WHY SAFEGUARD?

According to Occupational Safety and Health Administration (OSHA) statistics, nearly 18,000 workers in metal fabricating plants suffer non-fatal injuries annually in the United States. Even with strict machine and operator safety regulations in place, unguarded hazardous machinery remains a major source of fatalities, amputations and other traumatic injuries in manufacturing plants. A recent survey showed an alarming 50 percent or more of metal fabricating machinery in the United States are not in compliance with the critical safety requirements for guarding outlined by OSHA and the American National Standards Institute (ANSI).

Whether driven by the law, social responsibility or the need for a positive return on investment (ROI), most organizations embark on a quest to make their workplaces safe. The business case for machine safeguarding is solid. By comparing the installation cost of safeguarding over the productive life of a machine versus the direct and indirect costs of even a single accident, it becomes clear that safeguarding makes sound business sense and should be a cornerstone of an organization’s safety goals and objectives.

Since 1971, the Fortune 500 and many of North America’s largest manufacturers have depended upon Rockford Systems for customized machine safeguarding solutions to bring their operations into compliance with today’s OSHA regulations and ANSI/RIA/NFPA standards to ensure they are prepared for tomorrow’s safety challenges.
OUR DIFFERENCE

Rockford Systems has the applications expertise to solve any organization’s most complex machine safety challenges. Our machine safety solutions are high-quality, flexible and trusted by industry.

Turnkey Machine Safety Solutions

Rockford Systems offers safeguarding training, on-site risk and machine safeguarding assessments, annual press safety inspections, pre-acquisition audits, customized engineered solutions, over 10,000 safeguarding products, quality installation and post-sale support. This turnkey solution allows customers the convenience of one-stop shopping for all of their machine safety needs, as well as provides peace-of-mind working with a globally trusted safety partner such as Rockford Systems.

RSXpress

RSXpress, a proprietary assessment tool, integrates Rockford System’s surveying expertise with a cloud-based digital platform, allowing the company to generate safeguarding proposals up to 50 percent faster than legacy methods. RSXpress is designed to meet the needs of today’s “always on” plant safety and operations managers and to deliver the timely, high-quality service experience that they expect in the digital age.

ROCKFORD SYSTEMS CAN HELP

Rockford Systems helps business large and small address industrial machine safety challenges and removes the burden of managing inspections, conducting assessments and overseeing standards compliance through our trusted turnkey solutions.

Workers who operate and maintain machinery suffer approximately 18,000 amputations, lacerations, crushing injuries, abrasions, and more than 800 deaths per year *

REDUCING RISK.  
IMPROVING SAFETY  
PROTECTING WORKERS

Training and Education
Recommended For  
EH&S, Production/ Operations/ Maintenance, and Risk Management roles that need safeguarding training
Description  
Seminars and webinars that teach people how to safeguard industrial machinery to be in compliance with OSHA regulations and ANSI/RIA/NFPA standards
Output / Result  
Safeguarding Seminar Certificate

Machine Risk Assessment
Recommended For  
Organizations with new and/or relocated metal working machines that need hazard identification and risk scoring
Description  
Identifies the task and associated hazards on machinery
Scores the risk level using the ANSI B11.0-2015 safety standard methods
Output / Result  
Hazard Analysis Report

Machine Safeguarding Assessment  
Recommended For  
Organizations with new, old, refurbished and/or relocated metal working machines that need safeguarding solutions and associated costs
Description  
Identifies the task and associated hazards on machinery
Recommends safeguarding solutions using the current OSHA regulations and ANSI/RIA/NFPA standards (or Corporate Standards where applicable)
Output / Result  
Machine Safeguarding Assessment & Proposal

Engineered Integration Solutions
Recommended For  
Included in Machine Safeguarding Proposal  
Description  
Delivers customized engineered and automated safety device interfaces or specialized controls for machines
Output / Result  
Customized build-to-spec solutions
THAT’S WHAT MAKES ROCKFORD SYSTEMS
THE TRUSTED CHOICE FOR
INDUSTRIAL MACHINE SAFETY

Safety Shields is a comprehensive catalog that features a complete line of equipment to protect operators of cutting and turning machines.

The polycarbonate and steel shields found in this catalog can be applied to drill presses, lathes, milling machines, bench grinders, band saws, and disc and belt sanders.

The catalog also offers emergency-stop devices, disconnect switches, magnetic motor starters, lockouts, and danger signs.

All products in this catalog are intended and designed to meet the requirements of OSHA and ANSI safety standards.

At Rockford Systems, we are experts at machine guarding because it has been our sole focus for over 50 years. We stand committed to the prevention of injuries and fatalities. Our mission is to enhance the long-term health and quality of life of workers in high-risk occupations, while improving the bottom line of the organizations we serve by increasing compliance, reducing risk, lowering costs and improving productivity.

**OSHA STANDARDS** ....................................................... 98
INTRODUCTION

There are basic safety requirements for safeguarding cutting and turning machines. These basic safety requirements include safeguarding, controls, disconnects, starters, covers, and other considerations. We have explained the basic safety requirements below and have arranged this catalog so you can make your safeguarding choices quickly and easily.

1. SAFEGUARDING: When safeguarding the point-of-operation on a cutting or turning machine, shields (barriers) can be installed between the hazard and the operator. These shields can deflect chips, sparks, and coolant that are generated at the point-of-operation.

2. CONTROLS: Most cutting and turning machines are directly driven by a motor. When the motor is turned on, the tool or workpiece rotates causing a point-of-operation hazard. When the motor is turned off, the tool or workpiece coasts to a stop and the hazard is eliminated. The basic requirement for controls is that all cutting and turning machines must have an emergency-stop device located within reach of the operator. Some of the motor stop/start operator stations offered in this catalog are equipped with an emergency-stop push button to meet this requirement. These emergency stop buttons can also be supplied separately.

3. DISCONNECTS: All cutting and turning machines must have a disconnecting means to shut off all pneumatic, electrical, and hydraulic power sources coming to the machine. It must be capable of being locked only in the off position to comply with OSHA 1910.305 (j)(4), applicable ANSI standards, and OSHA 29 CFR 1910.147 (lockout/tagout).

4. STARTERS: All cutting and turning machines must have a starter that will automatically drop out when the control voltage is lost to the machine. To restart the machine when power is restored, someone must start the motor with some type of overt action, for example, pressing the start push button. This prevents the machine from automatically restarting when the voltage is restored.

5. COVERS: All cutting and turning machines must have the mechanical power-transmission apparatuses covered (guarded) if below a 7’ level from the floor or working platform. This includes motor shafts, belts, pulleys, chains, sprockets, gears, etc.

6. OTHER CONSIDERATIONS: Other auxiliary safeguarding equipment may be required to make cutting and turning machines as safe as possible.
INTRODUCTION

OSHA PUBLICATIONS

When safeguarding cutting and turning machines, the general requirements that apply to these types of machines are in OSHA (Occupational Safety and Health Administration) Title 29 of the Code of Federal Regulations (CFR). These publications can be acquired by contacting:

U.S. Government Printing Office
P.O. Box 371954
Pittsburgh, PA 15250-7954

The following is a list:

8. OSHA 29 CFR sections that an employer (user) must comply with include:
   1910.211 Definitions
   1910.212 General requirements for all machines
   1910.213 Woodworking machinery requirements
   1910.215 Abrasive wheel machinery
   1910.219 Mechanical power-transmission apparatus

The basic OSHA standard, 29 CFR 1910.212, states that any machine that creates a hazard must be safeguarded to protect the operator and other employees. OSHA can also cite violations using other standards such as the ANSI (American National Standards Institute) B11 series.

ANSI Publications

B11–2008 General Safety Requirements
Common to ANSI B11 Machines
B11.6* Lathes
B11.9* Grinding Machines
B11.19* Performance Criteria for Safeguarding
B11.23* Machining Centers and CNC Milling, Drilling, and Boring Machines B11.24 Transfer Machines
B11.TR1 Ergonomic Guidelines
B11.TR3* Risk Assessment and Risk Reduction
B15.1 Mechanical Power Transmission Apparatus
O1.1* Woodworking Machinery
*ANSI Standards for Cutting and Turning Machines

These standards can be purchased by contacting:

ANSI (American National Standards Institute, Inc.)
25 West 43rd Street, 4th Floor
New York, New York 10036
(212) 642-4900 • www.ansi.org

Other Publications

1. NFPA 79, Electrical Standard for Industrial Machinery
2. NEC (National Electrical Code) Handbook
3. NEMA (National Electrical Manufacturers Association)
4. Robotics Industry Association (RIA)

For additional safety information and assistance in devising, implementing or revising your safety program, please contact the machine manufacturer, your state and local safety councils, insurance carriers, national trade associations, and your state’s occupational safety and health administration.

The shields (barriers) offered in this catalog are usually installed on drilling machines, lathes, milling machines, grinding machines, band saws, belt sanders, and disc sanders. Many of the shields can be used on other types of equipment including woodworking machines and robotics. Most of these shields are intended to deflect chips (swarf), sparks, splashing coolant, or lubricant away from the operator and other employees in the machine area. Shields provide visibility to the point-of-operation. Although these shields provide some degree of guarding for the operator, they cannot be considered guards. When using these shields, and before any of the shields illustrated in this catalog are moved from their normally applied position, power must always be turned off. In some cases, more than one type of shield per machine may be necessary to provide protection. For example, on lathes, a chuck shield may be required along with a cross shield where the tool comes into contact with the workpiece. This catalog offers several different types of shields. When considering shielding for your machines, be sure to choose the shield that fits your machining applications and still maintains current levels of productivity.
INTRODUCTION

DRILLING MACHINES

As with other cutting machines, the operator must be shielded from the rotating chuck and swarf that is produced by the drill bit. A wide variety of shields can be attached to the machine and used to protect this area. The ANSI standard for drilling machines is ANSI B11.8.

LATHES

There are three main safety considerations for lathes (engine, turret, etc.). One is the rotating chuck that could catch the operator’s clothing, jewelry, hair, or hand and pull it into the machine. The second is the hazardous flying chips and splashing coolant that are generated at the point-of-operation (where the tool contacts the workpiece being machined). To protect these areas, two shields can be applied—one around a portion of the chuck and the other at the point-of-operation. Larger sliding shields can protect both areas, providing the workpiece is not too long. The third is the rotating transmission components that must be covered to prevent entanglement. The ANSI standard for lathes is ANSI B11.6.

MILLING MACHINES

The main safety consideration for milling machines is the swarf that is generated at the point-of-operation. Another safety concern is the tool cutter, which could catch operator’s clothing, jewelry, hair, or any other part of the body. Usually on smaller mills, the operator and other employees in the machine area are protected by shields. These shields can be applied around the perimeter of the table or bed area or close to the cutter, depending on the size of the workpiece and the application. On larger milling machines, operators are sometimes protected by location; however, when working close to a cutting tool, operators must be protected from swarf. The ANSI standard for milling machines is ANSI B11.8.

GRINDING MACHINES

Shields are usually applied to grinding machines to protect the operator from chips (swarf), sparks, splashing coolant, or lubricant. Other safety concerns for grinders are the adjustment of the work rests and the adjustable tongues or ends of the peripheral members at the top of each wheel. Work rests shall be kept adjusted closely to the wheel with a maximum opening of 1/8”. The distance between the wheel periphery and the adjustable tongue or the end of the peripheral member at the top shall never exceed 1/4”. Grinding machines are covered by OSHA in 29 CFR 1910.215. The ANSI standards for grinding machines are B11.9 and B7.1.

BAND AND TABLE SAWS

Shields are applied to band saws and table saws to protect the operator from flying chips, splinters, and dust. As with other cutting machines, care must be taken around the moving blade of the machine. Avoid wearing loose clothing and jewelry; properly restrain long hair. Band saws and table saws for woodworking are covered by OSHA in 29 CFR 1910.212 and 1910.213. The ANSI standard for metal sawing machines is ANSI B11.10.

DISC/BELT SANDERS/GRINDERS

Shields can be applied to disc/belt sanders/grinders to protect the operator from flying chips, splinters, and dust. As with other machines with rotating parts, care must be taken around the point-of-operation. Avoid wearing loose clothing and jewelry; properly restrain long hair. Disc and belt sanders for woodworking are covered by OSHA in 29 CFR 1910.212 and 1910.213. The ANSI standards for grinding machines are B11.9 and B7.1.

LOCKOUT/TAGOUT

As stated in OSHA 29 CFR 1910.147 The control of hazardous energy (lockout/tagout): “(a)(1)(i) This standard covenergizing or start-up of the machines or equipment, or release of stored energy could cause injury to employees. This standard establishes minimum performance requirements for the control of such hazardous energy.”

1. Unplug the machine and use an electrical plug lockout or use a disconnect switch with padlocks, lockouts, and tags.

2. Disconnect and ensure that all power sources are locked and tagged out.

3. Stored electrical energy must be bled to obtain zero energy state.

4. Use a volt meter to make sure all circuits are dead.

ELECTRICAL REQUIREMENTS NFPA 79, ELECTRICAL STANDARD FOR INDUSTRIAL MACHINERY

INCOMING SUPPLY CIRCUIT CONDUCTOR TERMINATIONS

Under 5.1.1, it states that “where practicable, the electrical equipment of a machine shall be connected to a single power supply circuit.”

SUPPLY CIRCUIT DISCONNECTING (ISOLATING) MEANS

In 5.3.1.1, it states that a supply circuit disconnecting means shall be provided for each incoming supply circuit to a machine. According to 5.3.1.1.1, each disconnecting means shall be legibly marked to indicate its purpose. Under 5.3.1.3, “The supply circuit disconnecting means other than attachment plugs and receptacles shall be mounted within the control enclosure or immediately adjacent thereto. Exception: Externally mounted supply circuit disconnecting means, whether interlocked or not interlocked with the control enclosure, supplying machines totaling 2hp or less shall be permitted to be mounted up to 6m (20ft) away from the
INTRODUCTION

enclosure providing that the disconnecting means is in sight from and readily accessible to the operator." Under 5.3.3, the disconnecting means shall be provided with permanent means for locking in the off position only (for other than attachment plugs). In accordance with 5.3.4.1, “The center of the grip of the operating handle of the disconnecting means, when in its highest position, shall not be more than 2.0 m (6 ft 7 in) above the floor. A permanent operating platform, readily accessible by means of a permanent stair or ladder, shall be considered as the floor for the purpose of this requirement.” According to 5.3.2 (6), the supply circuit disconnecting means can be an attachment plug and receptacle (plug/ socket combination) for cord connection to motor loads totaling 2hp or less.

CONTROL CIRCUIT SUPPLY, VOLTAGE, AND PROTECTION

In 9.1.1.1, it states that “Control transformers shall be used for supplying the control circuits.” According to 9.1.1.3, “Transformers shall not be required if the supply voltage does not exceed 120 volts ac.” In accordance with 9.1.2.1, “The ac voltage for control circuits shall not exceed 120 volts, ac single phase.” According to 9.1.3, control circuits shall be provided with overcurrent protection.

OVERLOAD PROTECTION OF MOTORS

According to 7.3.1, “Overload devices shall be provided to protect each motor, motor controller, and branch-circuit conductor against excessive heating due to motor overloads or failure to start.”

STOP FUNCTIONS

According to 9.2.2, “The three categories of stop functions shall be as follows:

1. Category 0 is an uncontrolled stop by immediately removing power to the machine actuators.
2. Category 1 is a controlled stop with power to the machine actuators available to achieve the stop then remove power when the stop is achieved.
3. Category 2 is a controlled stop with power left available to the machine actuators.”

In 9.2.5.3.1, it states that “Each machine shall be equipped with a Category 0 stop.” According to 9.2.5.3.2, “Category 0, Category 1, and/or Category 2 stops shall be provided where indicated by an analysis of the risk assessment and the functional requirements of the machine. Category 0 and Category 1 stops shall be operational regardless of operating modes, and Category 0 shall take priority. Stop function shall operate by de-energizing that relevant circuit and shall override related start functions.”

EMERGENCY STOP FUNCTIONS

In accordance with 9.2.5.4.1, emergency stop functions shall be designed to be initiated by a single human action. In addition to the requirements for stop, 9.2.5.4.1.1 states that “the emergency stop shall have the following requirements:

1. It shall override all other functions and operations in all modes.
2. Power to the machine actuators, which causes a hazardous condition(s), shall be removed as quickly as possible without creating other hazards (e.g., by the provision of mechanical means of stopping requiring no external power, by reverse current braking for a Category 1 stop).
3. The reset of the command shall not restart the machinery but only permit restarting.”

In 9.2.5.4.1.2, it states that “Where required, provisions to connect additional emergency stop devices shall be provided.” According to 9.2.5.4.1.3, “The emergency stop shall function as either a Category 0 or a Category 1 stop. The choice of the category of the emergency stop shall be determined by the risk assessment of the machine.” In accordance with 9.2.5.4.1.4, “Where a Category 0 or Category 1 stop is used for the emergency stop function, it shall have a circuitry design (including sensors, logic, and actuators) according to the relevant risk as required by Section 4.1 and 9.4.1. Final removal of power to the machine actuators shall be ensured and shall be by means of electromechanical components. Where relays are used to accomplish a Category 0 emergency stop function, they shall be non-retentive relays.

Exception: Drivers, or solid state output devices, designed for safety related functions shall be allowed to be the final switching element, when designed according to relevant safety standards.”

DEVICES FOR STOP AND EMERGENCY STOP

In accordance with 10.7.1.1, “Stop and emergency stop pushbuttons shall be continuously operable and readily accessible.” According to 10.7.1.2, “Stop or emergency stop pushbuttons shall be located at each operator control station and at other locations where emergency stop is required.”

In 10.7.2.1, it states that “The types of devices for emergency stop shall include, but are not limited to, the following:

1. Pushbutton-operated switches
2. Pull-cord-operated switches
3. Foot-operated switches without a mechanical guard
4. Push-bar-operated switches
5. Rod-operated switches”

According to 10.7.2.2, “Pushbutton-type devices for emergency stop shall be of the self-latching type and shall have direct opening operation.” In accordance with 10.7.2.3, “Emergency stop switches shall not be flat switches or graphic representations based on software applications.” For restoration of normal function after emergency switching off circuit until the emergency switching off circuit has been manually reset.” According to 10.7.3, “Actuators of emergency stop devices shall be colored RED. The background immediately around pushbuttons and disconnect switch actuators used as emergency stop devices shall be
INTRODUCTION

colored YELLOW. The actuator of a pushbutton-operated device shall be of the palm or mushroom-head type and shall effect an emergency stop when depressed. The RED/YELLOW color combination shall be reserved exclusively for emergency stop applications.

Exception: The RED/YELLOW color combination shall be permitted for emergency stop actuators in accordance with 10.8.4.

Under 10.8.5, “Where the supply disconnecting means is to be locally operated for emergency switching off, it shall be readily accessible and shall meet the color requirements of 10.8.4.1.” According to 10.8.4.1, “Actuators of emergency switching off devices shall be colored RED. The background immediately around the device actuator shall be permitted to be colored YELLOW.”

PUSHBUTTON ACTUATORS

According to 10.2.1, “Pushbutton actuators used to initiate a stop function shall be of the extended operator or mushroom-head type.” As stated in 10.2.2.1, “The preferred color of start or on shall be GREEN, except that BLACK, WHITE, or GRAY shall be permitted. RED shall not be used for start or on.” In 10.2.2.2, it states that “the preferred color for stop or off shall be RED, except that BLACK, WHITE, or GRAY shall be permitted. GREEN shall not be used for stop or off.” According to 10.2.2.6, “Pushbuttons that cause movement when pressed and stop movement when they are released (e.g., jogging) shall be BLACK, WHITE, GRAY, or BLUE, with a preference for BLACK.” In accordance with 10.2.3.1, “A legend shall be provided for each operator interface device to identify its function and shall be located so that it can be easily read by the machine operator from the normal operator position. The legends shall be durable and suitable for the operating environment.”

START DEVICES

According to 10.6, “Actuators used to initiate a start function or the movement of machine elements (e.g., slides, spindles, carriers) shall be constructed and mounted to minimize inadvertent operation.” Protection Against Supply Interruption or Voltage Reduction and Subsequent Restoration Under 7.5.1, “Where a supply interruption or a voltage reduction can cause a hazardous condition or damage to the machine or to the work in progress, undervoltage protection shall be provided (e.g., to switch off the machine) at a predetermined voltage level.” For restarting, 7.5.3 states that “Upon restoration of the voltage or upon switching on the incoming supply, automatic or unintentional restarting of the machine shall be prevented when such a restart causes a hazardous condition.”

PROTECTIVE INTERLOCKS

In 9.3.6, it states that “Where doors or guards have interlocked switches used in circuits with safety related functions, the interlocking devices shall be listed, have either positive (direct) opening operation, or provide similar reliability and prevent the operation of the equipment when the doors or guards are open (difficult to defeat or bypass).” Under 9.3.1, “The reclosing or resetting of an interlocking safeguard shall not initiate machine motion or operation that results in a hazardous condition.”
CREATING A SAFER WORK ENVIRONMENT

Rockford Systems LLC, a leader in machine safeguarding solutions, introduces PROTECTOR™ Series Shields. This highly innovative and patent-pending product line improves the safety and productivity of operators working with dangerous machinery.

CUSTOMER-DRIVEN SOLUTIONS

With over 50 years of industrial safety experience, Rockford Systems has integrated over 25,000 machine safeguarding solutions and collaborated extensively with Environmental Safety & Health (EHS) leaders, supervisors, operators and maintenance personnel across a variety of industries. We leveraged this wealth of knowledge and applications expertise into the design and production of our newest innovation:

PROBLEM:
» Equipment operators complain that safeguarding shields limit visibility because of reflectivity or obstruction and nearby clip-on lamps get too hot.

SOLUTION:
» PROTECTOR Series Shields are manufactured with scratch-resistant polycarbonate and incorporate cool, bright LED lighting into the shield frame to yield superior visibility of the work area.

PROBLEM:
» Supervisors report that safeguarding shields can be bypassed when shields get pushed out of the way or are tampered with, thereby making the machines unsafe to operate.

SOLUTION:
» PROTECTOR Series Shields are offered in both non-interlocked and interlocked versions, the latter of which disengages power and prevents a machine start-up when the shield is not closed.
» PROTECTOR Series Shields feature a tamper-resistant interlock enclosure and available redundant safety monitoring. The safety relay monitors the interlock switch for failure, providing a notification if the interlock has been removed or is not functioning correctly.

PROBLEM:
» EHS professionals need to maximize safety while minimizing expenses, thereby generating a positive return on investment (ROI).

SOLUTION:
» PROTECTOR Series Shields are modular in design and easily configurable to tailor a custom fit for any machine application, thereby optimizing employee safety and generating a positive ROI.

A PATENT-PENDING, HIGH-QUALITY, HIGHLY-FEATURED LINE OF ROBUST MACHINE SAFEGUARDING SHIELDS THAT MAXIMIZE SAFETY, IMPROVE PRODUCTIVITY AND REDUCE RISK.
ROBUST CONSTRUCTION

PROTECTOR Series Shields are constructed of 14-gauge powder-coated steel and 3/16” shock-proof and oil-resistant polycarbonate, creating an extremely tough, rigid and durable safety shield to protect operators from flying debris, lubricants, coolants and swarf. All components carry a CE, UL and CSA certification and shields feature a limited one-year warranty. A full line of replacement polycarbonate shields is available to keep shields operating at peak efficiency.

MODULAR DESIGN

PROTECTOR Series Shields are modular in design so that shield shape, size, mount, arm, offset, lighting, interlocking and safety monitoring can be configured to provide the best solution for even the toughest machine guarding challenge. Available with various mounting options, these high-quality shields allow for reversal to address opposite-hand mounting scenarios when necessary. All shields are vertically and horizontally adjustable to clear varying work setups and table heights.

Rockford Systems configured the most popular shields for milling and drilling machines, lathes and grinders, which represent over 95 percent of all safeguarding applications. However, for those unusual applications or hard-to-guard machines, PROTECTOR Series Shields can be configured into over 60,000 modular combinations to ensure a precise, customized fit to improve worker safety.

Shield Options:

- Octagonal Shield
- Curved Shield
- 3 Sided Shield
- 2 Sided Shield
- Flat Shield
- Dual Flat Shield
- Octagonal Shield without Handle

Arm Options:

- Single Pivot 3 Arms
- Double Pivot 3 Arms
- Single Pivot 2 Arms
- Double Pivot 2 Arms
- Direct Mount

Mount Options:

- Left Mount
- Center Mount
- Right Mount
WORKSPACE SAFETY LIGHTING

PROTECTOR Series Shields can include color-changing LED lighting nested into the frame of the shield to illuminate the work area during machine operation. The LED light strip is integrated into the shield frame and each strip packs 262 Lumens of light per linear foot. For example, the PROTECTOR 28” octagonal or circular shield provides 2180 Lumens, compared to a typical clip-on work lamp that provides only 800 Lumens. Operators will appreciate the non-reflective, true-color rendering white light illuminating their work area. When the shield is moved out of the safe work position, white LEDs switch off and red LEDs switch on, thereby providing visual indication that the shield is in the open position. All LED lighting has been manufactured to exacting IEC IP65 outdoor/wet location standards to withstand coolant and lubricant splashes.

![Lathe Chuck without Illumination](image1)
![Lathe Chuck Illuminated with WHITE LEDS in “run” position](image2)
![Lathe Chuck Illuminated with RED LEDS in “stop” position](image3)

SAFETY INTERLOCKS & MONITORING

PROTECTOR Series Shields can be upgraded with a safety interlock switch or switches, dependent upon application. Interlocking shields exceed OSHA regulations and ANSI standards and are considered a best safety practice.

Shield interlocks shut off or disengage power and prevent machine start-up when the guard is not closed, thereby increasing operator safety and preventing operating bypassing. All safety-rated interlock switches are mounted in a tamper-resistant NEMA 4 housing, comply with the IEC/EN 60947 safety standard and carry IEC IP66/67 device ratings. Additional motor starter or anti-restart devices may be required when incorporating interlocking devices into the PROTECTOR Series Shields in order to ensure safe and compliant operation.

To achieve a Category 2 rating, a safety monitoring relay can be added as a redundant level of security, monitoring the integrity of the interlocking feature so that a removed or failed safety interlock will not permit unsafe operation of the machine.

![Interlock](image4)
![Non-Interlock](image5)

MADE IN THE USA

In recent months, it has become clear that complex international supply chains are not resilient to the immediate sourcing needs of organizations. PROTECTOR Series Shields are manufactured by Rockford Systems LLC in Rockford, Illinois, USA. All shields are shipped within 2-3 weeks of order.

CONTACT US

Our team is always ready to help customers, discuss their unique applications, and solve their machine safety problems. Call 1-800-922-7533 or visit www.rockfordsystems.com.

CUSTOMIZABLE PROTECTOR™ SERIES SHIELDS

To create a PROTECTOR Series Shield, determine the 14-digit configurated part number by following directions 1 - 6 and use the information in the PART NUMBERING SYSTEM CHART (see next page).

1 – The first 3 characters will always be RSS (Rockford Systems Shields)
2 – The first 3 digits will determine the type and size of the shield and LED lighting option
3 – Digit 4 will determine the shield mount
4 – The next 4 digits will determine the shield arm type, pivot, reach and interlock option
5 – The next 2 digits will determine the shield offset
6 – The last digit will determine with enclosure (interface type), depending upon the LED and interlock options selected:
   If you have selected no LED, then you should select “No Enclosure” (0)
   If you have selected LED and no interlock, then you should select “Lighted – Non-Interlocked Enclosure” (1)
   If you have selected LED and interlock, then you should select “Lighted – Interlocked Enclosure” (2)
   If you have selected LED and interlock and monitoring, then you should select “Lighted – Interlocked & Monitored Enclosure” (3)

### LED Lighting? | Interlock? | Monitored? | Group 6 Option
--- | --- | --- | ---
NO | NO | NO | 0
YES | NO | NO | 1
NO | YES | NO | 0
YES | YES | NO | 2
YES | YES | YES | 3

SHIELDS FOR DRILLS

Available in a variety of sizes, shapes and customizable options, Protector Shields for drills protect the operator from direct frontal contact with rotating spindle parts, flying debris and coolants/lubricants.

A – 1/4” steel mounting/pivot bracket with ball bearings – vertical or horizontal mounting – 120º rotation

B – Safety-rated microswitch (optional) mounted in tamper-resistant steel enclosures – 1 NO, 1 NC contacts

C – Adjustable shield-mounting clamp in 7GA steel – allows for radial and axial position adjustment

D – Available built-in LED lighting – lights your work, indicates available Interlock status

E – Heavy 14GA steel formed and welded shield frame with durable powder coat finish

F – 3/16” thick polycarbonate shock-proof & oil-resistant shield

SHIELDS FOR MILLS

Available in a variety of sizes, shapes and customizable options, Protector Shields for mills protect the operator from direct frontal contact with rotating spindle parts, flying debris and coolants/lubricants.

A – Sturdy, tubular steel mounting post with leveling taps – provides 8” of adjustment

B – Safety-rated microswitches (optional) mounted in tamper-resistant steel enclosures – 1 NO, 1 NC contacts

C – Adjustable shield-mounting clamp in 7GA steel – allows for radial and axial position adjustment

D – Tubular steel Articulating arms with anti-slip discs – 2 & 3 segments available for a reach of 16”-36”

E – Available built-in LED lighting – lights your work, indicates available Interlock status

F – Heavy 14GA steel formed and welded shield frame with durable powder coat finish

G – 3/16” thick polycarbonate shock-proof & oil-resistant shield

H – 1/4” steel pivot/switch bracket with ball bearings – vertical or horizontal mounting – 120º rotation
**SHIELDS FOR LATHES**

Available in a variety of sizes, shapes and customizable options, Protector Shields for lathes prevents the operator from direct contact with rotating chuck and helps in containing the lubricant/collant and working swarfs.

A – 1/4” steel mounting/pivot bracket with ball bearings – vertical or horizontal mounting – 120º rotation
B – Safety-rated microswitch (optional) mounted in tamper-resistant steel enclosures – 1 NO, 1 NC contacts
C – Adjustable shield-mounting clamp in 7GA steel – allows for radial and axial position adjustment
D – Available built-in LED lighting – lights your work, indicates available Interlock status
E – Heavy 14GA steel formed and welded shield frame with durable powder coat finish
F – 3/16” thick polycarbonate shock-proof & oil-resistant shield

**SHIELDS FOR GRINDERS**

Available in a variety of sizes, shapes and customizable options, Protector Shields for grinders prevents the operator from the projection of sparks and emery.

A – 1/4” steel mounting/pivot bracket with ball bearings – vertical or horizontal mounting – 120º rotation
B – Safety-rated microswitch (optional) mounted in tamper-resistant steel enclosures – 1 NO, 1 NC contacts
C – Adjustable shield-mounting clamps in 7GA steel – allow for radial and axial position adjustment
D – Available built-in LED lighting – light your work, indicate available Interlock status
E – Heavy 10GA steel formed top frames with durable powder coat finish
F – 3/16” thick polycarbonate shock-proof & oil-resistant shields

</table>
TERMS AND CONDITIONS OF SALE PRICES

A. Prices specified include no federal, state, local, use, occupational, foreign, or other tax. Taxes, if applicable, will be added to the invoice. Unless otherwise stated, all prices are in U.S. dollars.

B. The prices include our regular packaging only. Any special packaging requested by the customer, including special protection for export shipment, will be at the customer’s expense, and the cost of such special packaging shall be in addition to the prices quoted.

PAYMENT TERMS: Net in 30 days for equipment and net in 10 days for installation, service, and machine safeguarding assessments (with approved credit). Machine safeguarding seminar fees are due at the time of service. A 1½% monthly service charge (18% a year) will be added to past-due accounts.

CREDIT POLICY: Customers with established credit may purchase for immediate processing of orders. Customers not previously established with us or suitably rated by D&B must apply for open-account status. Orders received without suitable credit information must be prepaid in full before shipment. MasterCard, Visa, and American Express credit cards are accepted.

MINIMUM ORDER: Our minimum order is $25.00. Orders received for less than $25.00 will be subject to a service charge to bring the total to $25.00.

CANCELLATION FEE: Orders that are canceled prior to shipment may be subject to a cancellation fee if the products are nonstock, custom, special, or built to order.

SHIPPING AND HANDLING: Parcels are normally shipped prepaid via our carrier of choice with the charges added to the invoice, but they can also be sent collect or via consignee billing against the customer’s account. Truck shipments are normally shipped collect, but they can also be shipped prepaid with the charges added to the invoice via our carrier of choice. A handling charge will be added to all invoices except for customer-pickup orders.

INSURANCE: All shipments are insured for the standard amount provided by the carrier. Additional insurance may be purchased at the customer’s expense.

RISK OF LOSS: Unless otherwise agreed upon, all equipment will be shipped FOB shipping point. Title and risk of loss will pass to the customer upon delivery to the carrier at the point of shipment. Transportation will be at the customer’s risk and expense, and any claim for loss or damage in transit must be made directly against the carrier.

RETURNED MERCHANDISE: Returned merchandise must be authorized by Rockford Systems in advance, at which time an RMA (return materials authorization) number will be issued. No returned merchandise will be accepted unless accompanied by an RMA number and this RMA number plainly identified on the outside of the shipping container. Material returned without this RMA number will be refused by our receiving department. All returned shipments must be prepaid. The minimum restocking charge will be 25% for any material not found to be defective. Such merchandise must be in original condition and unused in order to qualify for credit. Custom, special, or built-to-order items may not qualify for any credit; however, they may be returned for modification, if needed, which may be at an additional cost. No returns for credit will be considered more than 30 days from the date of shipment.

LIMITED WARRANTY: Rockford Systems, LLC, warrants that this product will be free from defects in material and workmanship for a period of 12 months from the date of shipment thereof.
PROTECTOR™ SERIES SHIELDS

ROCKFORD SYSTEMS LLC’S OBLIGATION UNDER THIS WARRANTY IS EXPRESSLY AND EXCLUSIVELY LIMITED to, at the sole discretion of Rockford Systems, LLC, providing a refund or credit for the amount paid for such Product or repairing or replacing such products, in each case solely for Products which are returned to it with-in the warranty period with shipping charges prepaid and which are found by Rockford Systems, LLC to be defective upon examination. This warranty will not apply to products damaged in natural disasters, including, but not limited to, earthquakes, fires and floods, or any product which will have been subject to misuse, negligence, accident, restriction, or use not in accordance with Rockford Systems, LLC’s instructions or which will have been altered or repaired by persons other than the authorized agent or employees of Rockford Systems, LLC. Rockford Systems, LLC’s warranties as to any component part is expressly limited to that of the manufacturer of the component part. This warranty only extends to the original Customer and can-not be transferred or assigned.

DISCLAIMER THE FOREGOING WARRANTY IS MADE IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, AND OF ALL OTHER LIABILITIES AND OBLIGATIONS ON THE PART OF ROCKFORD SYSTEMS, LLC, INCLUDING ANY LIABILITY FOR NEGLIGENCE, STRICT LIABILITY, OR OTHERWISE, AND ANY IMPLIED WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE IS EXPRESSLY DISCLAIMED. PRODUCTS ARE SOLD BUSINESS TO BUSINESS AND NOT TO CONSUMERS, RENDERING ANY CONSUMER LAW INAPPLICABLE. THE FOREGOING WARRANTY CONTAINS AND REPRESENTS THE ONLY WARRANTY EXTENDED BY ROCKFORD SYSTEMS, LLC FOR THE PRODUCTS. NO EMPLOYEE OR AGENT OF ROCKFORD SYSTEMS, LLC IS AUTHORIZED TO MAKE AVAILABLE TO CUSTOMER ANY OF THERE WARRANTY IN ADDITION TO THE FOREGOING WARRANTY.

LIMITATION OF LIABILITY UNDER NO CIRCUMSTANCES, INCLUDING ANY CLAIM OF NEGLIGENCE, STRICT LIABILITY OR OTHERWISE, WILL ROCKFORD SYSTEMS, LLC, BE LIABLE FOR ANY INCIDENTAL, SPECIAL OR CONSEQUENTIAL DAMAGES, OR ANY LOSS OR DAMAGE RESULTING FROM A DEFECT IN THE PRODUCT OF ROCKFORD SYSTEMS, LLC, IN EACH CASE WHETHER INCURRED BY CUSTOMER OR OTHERS DIRECTLY OR INDIRECTLY ARISING FROM THE SALE, HANDLING OR USE OF THE PRODUCTS OR FROM ANY OTHER CAUSE WITH RESPECT TO THE PRODUCTS, WHETHER SUCH CLAIM IS BASED UPON BREACH OF CONTRACT, BREACH OF WARRANTY, STRICT LIABILITY IN TORT, NEGLIGENCE OR ANY OTHER LEGAL THEORY (INCLUDING LOST BUSINESS OPPORTUNITIES BUSINESS INTERRUPTION OR OTHER INJURY OR DAMAGE. IN NO EVENT SHALL ROCKFORD SYSTEMS’S LIABILITY WITH REGARD TO THE SALE OF PRODUCT EXCEED THE ORIGINAL PURCHASE PRICE PAID BY CUSTOMER.

GOVERNING LAW These terms and conditions, and use of this website, shall be governed by and construed in accordance with the laws of the State of Illinois, without reference to principles of conflicts of laws. The rights and obligations of the parties hereunder shall not be governed by the 1980 U.N.

Convention on Contracts for the International Sale of Goods. Any provision which is prohibited or unenforceable in any jurisdiction shall, as to such jurisdiction, be ineffective to the extent of such prohibition or unenforceability of such provision in any other jurisdiction.

UNGUARDED DRILL PRESS

ALWAYS wear proper personal protective equipment when operating this machine. This sign does not cover all dangers that could happen while operating this machine. Do Not Remove or Cover This Sign – See Back For Mounting Instructions

You are exposed to moving machine parts that can crush, dismember and cause death. DO NOT operate this machine without shield(s) in place. NEVER place your fingers, hands or any part of your body on or near the rotating parts of this machine. NEVER operate this machine with loose clothing, jewelry, or unrestrained long hair. FAILURE to obey will result in loss of fingers or limbs, or could cause death.

FLYING PARTS
You are exposed to moving machine parts that can cause eye or bodily injury due to hazardous flying chips, sparks, and coolant splash. NEVER operate this machinery without proper eye and body protection. FAILURE to obey will result in eye injury or severe personal injury.

SAFETY CHIP SHIELDS

These sturdy safety chip shields provide protection from flying chips, coolant, and rotating parts. They are usually applied to small drill presses, milling machines, etc., and can be magnetically or permanently mounted.

The shield can be attached to any smooth ferrous surface on the machine by an 80-lb pull, 3¼” diameter magnetic base. If a smooth, ferrous surface is not available, a 3¼” x 5¼” mounting plate is also furnished with each shield.

The impact-resistant, 3/16”-thick clear polycarbonate shield provides visibility to the point of operation. It adjusts and locks in any vertical position.

3 ¼” x 5 ¼” Mounting Plate Furnished With Each Type of Shield For Mounting to a Rough, Nonferrous Surface
HEAVY-DUTY ALUMINUM DRILL PRESS SHIELDS

These cast-aluminum drill press shields are furnished with a standard 1¾” bore. The user can bore this shield to a size up to 3½” for attaching to the quill of a machine.

This shield is available in 2-tier or 3-tier models which provides 3” to 6” travel of the drill press.

The top of the holder attaches to the quill of the drill press. The shields are open in the back. The bottom section has a clear panel for visibility.

For changing chucks or drill bits, the 2- or 3-tier section can be swung forward and upward out of the way. Also available are shields with a side hinge that swing to the left side.

SAFEGUARDING LATHES
**SLIDING LATHE SHIELDS**

These heavy-duty sliding lathe shields are furnished in four different sizes. They are constructed of high quality, 12-gauge reinforced steel with a polycarbonate window. These shields are available for operator protection on large standard lathes, CNC machines, and OD grinders.

The shields are designed to fit lathes with chucks up to 48" in diameter. Four adjustable flanged mounting posts are provided for easy mounting. These posts are used to securely mount the shield’s ball-bearing carriage to the top of the headstock, as illustrated (mounting hardware not included). This means the posts can be attached without interfering with any part of the equipment housed within the headstock.

These sliding shields slide out-of-the-way over the headstock, allowing the operator access to the point of operation for loading and unloading workpieces, changing tooling, changing chucks, removing swarf, etc. Each shield has approximately 22" of travel.

When ordering these sliding shields, check lathe dimensions and reference drawings. Special sizes are available on request.

**CROSSSLIDE-TRAVEL LATHE SHIELDS**

These lathe shields mount on and travel with the crosslide for protection when machining long workpieces. The 18-gauge reinforced steel structure provides protection from flying chips and coolant. The high-impact-resistant polycarbonate window permits visibility into the point of operation. The front portion of the shield hinges up for access. These shields are ideal for lathes with long beds. Special sizes are available on request.

These shields (KYL019 and KYL059) will be replaced with The Protector™ Series Shields. The Protector™ Series Shields (16", 20" or 24" size) are offered as basic, octagonal, 3 sided, single pivot, double pivot, interlocked, and interlocked and lighted forms. Basic Protector shown/pictured for all shield variations below.
SMALL STEEL LATHE CHUCK SHIELDS

These sturdily constructed steel chuck shields are fabricated of 18-gauge steel with reinforced sides and can be used on smaller lathes that have up to 18½" diameter chucks.

Each shield is furnished with a 1" x 13" mounting rod which can be cut to length if required. This mounting rod is fastened to the headstock of the lathe. The mounting rod is also used to hinge the entire shield. The shield can be lifted and swung up for quick and easy access to the chuck and the part being machined. This shield includes a high-impact-resistant polycarbonate window which permits visibility into the point of operation. Various types of mounting brackets are available and are sold separately.

LARGE STEEL LATHE CHUCK SHIELDS

These fabricated 18-gauge steel chuck shields with reinforced sides can be used on large lathes that have chucks up to 47" in diameter. They are double hinged for access to the chuck, workpiece, and tool. The front hinged portion can be swung up for workpiece changes, and the entire shield can be hinged back for changing chucks.

Each shield is furnished with a mounting rod, plate and support bar for mounting the shield to the face of the headstock. The rear mounting bracket hinges the entire shield, and the side mounting bracket supports the shield in its normal operating position.

STANDARD SIZE LATHE CHUCK WRENCHES

One of the most common accidents on lathes or other machines involves a chuck wrench or key which is thrown from the chuck. This happens when someone forgets to remove the wrench from the chuck before the machine is turned on.

The spring-loaded or self-ejecting chuck wrenches can be used on lathes or other machines equipped with manually adjusted chucks. The spring-loaded sleeve ejects the wrench from the chuck after each use. These wrenches are engineered and designed to provide proper loads for self-removal of the wrench weight.

CHIP SHIELDS FOR BRIDGEPORT MILLING MACHINES

These specially designed, quality-constructed shields are ideal for Bridgeport milling machines. They place a barrier between flying chips (swarf), sparks, coolant from the machine, and the operators or other employees in the area. They can be easily moved in or out of position to provide quick tool and part changes.

These shields are quick and easy to install. They attach directly to existing head machine bolts so no additional drilling or tapping is required.

These shields are constructed of high-impact-resistant polycarbonate material. Attached at the bottom of each section of the shield is durable, flexible neoprene material to keep flying chips and swarf contained as the bed moves up and down.

FRONT SHIELDS

The front shield is mounted on a heavy-duty universal steel arm which is used to swing it back into the exact position it was before tool or workpiece changes. The arm is 29" long and has an adjusting knob for raising and lowering the shield. The shield itself can also be used to hold a print.

BRIDGEPORT VERTICAL MILLING MACHINE CONTROLS

This control is designed for Bridgeport vertical milling machines that have a table motor. Each milling machine control is housed in a NEMA 12 enclosure that includes a disconnect switch, reversing magnetic main drive motor starter, a control relay for the table motor, and a 100 VA transformer that is generically numbered and wired to terminals. A remote station provides the operator controls consisting of a self-latching red emergency-stop palm button, an illuminated green table motor reset push button, and a main motor reverse/off/forward selector switch. These Bridgeport vertical milling machine controls are available for machines with 208, 230 or 460 VAC and 1 to 5 HP.

SLIDE AND SWING-ASIDE SHIELDS

INTRODUCTION
These shields protect operators when machining either small workpieces or large castings that sometimes overhang the milling machine table. At the same time, they can provide immediate and complete access to the workpiece or casting being machined by sliding or swinging aside the door(s), as illustrated.

THE SHIELD
The transparent portion of the shield is constructed of impact-resistant polycarbonate. The frame of the shield is made of 1” x 2” extruded aluminum. The shield has front sliding panel(s) and two side fixed panels. The side panels are attached at both ends of the table.

These assemblies can be mounted or removed in a matter of minutes by using two locking T-bolts with nuts.

Each of the front panels can slide to the right or left and swing aside on their own axis out of the way (see drawings).

The advantage of the slide and swing-aside movement is that you can obtain immediate access to the whole length of the table for loading and unloading large workpieces. Although the panels slide aside, they will not take up any more room than the actual length of the table itself, because the sliding and swing-aside action takes place in one movement by simply lifting a latch.

THE SHIELD CONSTRUCTION
The parallel sliding bars enable the shield to be adjusted to the distance required from the front of the table to the shield. The adjustment on these bars caters to castings or large components which overhang the table. This adjustment is achieved by loosening the two socket cap screws at either end of the table. This permits the complete shield assembly to be moved backwards or forwards to the position required.

A safety latch is provided where the two front panels or the front and side panels come together which holds the panels in place. The latch has to be released manually prior to opening the panels.

The unique construction allows the front panels to slide and swing aside exposing the entire table.
SLIDE AND SWING-ASIDE SHIELDS (CONTINUED)

There are three sizes of shields available which cover table sizes up to a maximum length of 76”. On bed-type milling machines, where the table length is well in excess of 76”, it is still possible to use the SSA300 shield. In many instances, only part of the maximum length of the table is used. If this is the case, the SSA300 shield would be suitable as long as the longitudinal traverse used does not exceed the maximum length of the shield. For a table length of less than 36”, the SSA000 shield may be used.

These shields have been generously designed to give protection to the operator; this will be noted in dimension H, which gives the height of the shields. Special height panels are available upon request.

The standard shield does not provide protection on the back of the table. The rear shields (below) are used to minimize coolant splash and flying chips that may fly out of the back of the machine.

**Has two sliding and swing front panels.

REAR SHIELD ASSEMBLIES

These shield assemblies can be used to protect personnel from swarf and chips at the rear of the table on both sides of the machine column. They can be used on milling machines or other equipment that require these types of shields. The two ¼”-thick polycarbonate panels are mounted to the frame of the machine with mounts (see photo). Each panel has extruded aluminum framing to hold the polycarbonate in place. The mounts are also attached to this frame. The assembly is available in two sizes and includes two shields, one set of mounts, and connectors. Special sizes are available upon request.

MILLING MACHINE BELT COVER

OSHA requires under 29 CFR 1910.219 that all mechanical power-transmission apparatuses on machinery that create a hazard be covered if below a 7-foot level from the floor or working platform. The sheaves and belts on milling machines must be covered to meet this requirement. These unique patented belt covers are made of durable cast aluminum. The hinged covers are sold in pairs for the right and left sides and are permanently attached to the machine. Spindle speed changes are done quickly and efficiently by simply pulling down the belt cover. This belt cover is made for Bridgeport model J.

Double- and Single-Wheel Flexible-Arm Grinder Shields

Bench grinder shields are designed to minimize the debris and hazards associated with bench grinders and buffers. Both double- and single-wheel grinder shields are available.

The double-wheel grinder shield provides protection for both wheels of the grinder with one continuous shield. The durable shield is made of clear, 3/16”-thick polycarbonate and measures 18” x 6”. A special shield bracket adds stability to the top of the shield.

The single-wheel grinder shield is made of clear, 3/16”-thick polycarbonate and measures 6” x 6”. This sturdy, impact-resistant shield is designed for use when a single wheel needs safeguarding.

The flexible spring-steel arms come in three lengths: 12”, 18” and 24”.

Mounting Options
There are two mounting options for the double- and single-wheel grinder shields.

- Direct-mount base—attaches directly to the grinder table or pedestal
- Magnetic base—3” diameter magnet

If an adequate flat, smooth, ferrous mounting surface is not available, an optional steel mounting plate is available that can be permanently attached to the machine to hold the magnetic base.

BENCH GRINDER SAFETY GAUGE—PART NO. KSC096

The bench grinder safety gauge is laser-cut, Grade 5052 aluminum with H32 hardness. The safety yellow, durable powder-coated gauge has silk-screened text and graphics. It measures 2¾” wide by 2¼” high by .1000” thick and has a ¼” hole for attachment to the bench grinder.

OSHA 29 CFR 1910.215 specifies that work rests must be kept adjusted closely to the wheel with a maximum opening of 1/8” to prevent the workpiece from being jammed between the wheel and the rest. OSHA also states that the distance between the grinding wheel and the adjustable tongue must never exceed ¼”.

The bench grinder gauge includes an 18” long plastic-coated, 18-8 stainless steel tether that is riveted to the gauge on one end and open to screw (hex head 1/2” long drilling screw #10 included) into a machine stand on the other, allowing you to keep your grinder gauge next to your bench grinder all the times and prevent it from getting lost or stolen.

BAND SAW SHIELD ASSEMBLIES

These high-quality band saw shields place a barrier between an operator and flying debris generated at the point of operation. The transparent, L-shaped portion of the band saw shield is constructed of high-impact-resistant, 3/16”- thick clear polycarbonate.

Flexible spring-steel arms come in standard lengths of 12”, 18”, and 24” for attaching the shield.

The band saw shield assemblies are offered with a direct-mount base that is attached directly to the band saw. Mounting hardware is included.

DISC AND BELT SANDER SHIELD ASSEMBLIES

These high-quality, adjustable disc and belt sander shields place a barrier between an operator and flying debris generated at the point of operation. They fasten directly to the machine using 1" x 2" extruded aluminum with mounting hardware included. The transparent portion of the shield is constructed of high-impact-resistant, 3/16"-thick clear polycarbonate. Easy vertical adjustment of the shields is achieved simply by loosening and tightening the black knobs.

These shields can also be used on a combination belt sander & disc sander.

Disc Sander Shield

Upper Belt Shield

Lower Belt Shield

Belt sander shield assembly.
ADJUSTABLE SLIDE SHIELDS

These high-quality adjustable slide shields can be used on drills, mills, saws, or special machine applications. The transparent portion of these shields is constructed of durable, clear 3/16"-thick polycarbonate. The shield places a barrier between an operator and the flying chips (swarf), sparks, and coolant generated at the point of operation.

These shields can be mounted vertically or horizontally on the flat surface of any machine. The transparent portion of the shield attaches to the mounting brackets and offers a slide adjustment of 3½". Two standard size shields with 30° sides are available: 7¾" x 11" and 9½" x 19". Contact Rockford Systems for other shield sizes or longer adjustments.

Adjustable slide shield on front column of machine.

RIGID-ARM MAGNETIC-BASE SHIELDS

These rugged magnetic-base shields can be used on lathes, small milling machines, drills, grinders, band saws, etc. These shields can be attached to any ferrous surface on the machine by an 80-lb pull magnetic base. If a flat, smooth, ferrous surface is not available, a mounting plate (3½" x 4-5/8") is also furnished. Large polypropylene plastic handles are used for easy positioning and locking.

The transparent portion of the chip shield is constructed of high-impact-resistant, 3/16”-thick clear polycarbonate material. It is furnished with a circular base which measures 3¼” in diameter. An 8” aluminum base extrusion is provided and attaches to the magnetic base. Also available is a 12” extruded-aluminum arm extension. This arm can be cut to a shorter length if required for your application.

UNIVERSAL BALL & SOCKET SHIELDS

A variety of these quality-constructed, very versatile shields are available. They are ideal for mills, drills, lathes, grinders, band saws, or similar equipment including woodworking machines. The shield places a barrier between operators or other employees in the area and the flying chips (swarf), sparks, and coolant generated from the tool. These shields are furnished with heavy universal steel ball-and-socket arms to provide simple movement and adjustment. Large polypropylene plastic handles are used for positioning and locking. Arms mount easily to the frame or column of the machine and include standard mounting hardware.

The shields offered are made of high-impact-resistant 3/16”-thick clear polycarbonate, selected for its toughness under impact to protect the operator. Each shield, except for the flat shield, has a hole in the left and right corners so the arm can be conveniently mounted on either side of the machine. Special size shields are available upon request.

FLEXIBLE SPRING-STEEL ARM SHIELDS

These flexible arms are made of high-quality, heavy-duty ¾”-diameter spring steel covered with vinyl to protect from grease, oil, and contaminants that could weaken their holding power. They offer virtually unlimited adjustment possibilities and long-term holding power.

The shield can be used on lathes, drill presses, milling machines, grinders, band saws, woodworking machines, and similar equipment. It places a barrier between an operator and flying chips (swarf), sparks, and splashing coolant generated at the point of operation. The transparent portion of these flexible-arm shields is constructed of high-impact-resistant, 3/16”-thick polycarbonate. Special shield sizes are available up to 12” x 12”; please call our sales department at 1-800-922-7533 for more information.

The flexible-arm shields have two mounting options: direct or magnetic. The direct-mount base can be fastened directly to a machine with two ¼” fasteners (included). The magnetic base consists of a 3”-diameter magnet with 100-lb holding force. If an adequate flat, smooth, ferrous mounting surface is not available, an optional steel mounting plate can be permanently attached to the machine to hold the magnetic base.

ON/OFF MAGNETIC-BASE SHIELDS

These versatile on/off magnetic-base shields can be used on lathes, drills, mills, grinders, or any equipment that has a flat, ferrous mounting surface. The heavy-duty magnetic base is 2¾” square with a V-groove and measures 3” high. The 200-lb holding force keeps the shield in place when the magnet is on. If an adequate flat, smooth, ferrous mounting surface is not available, an optional steel mounting plate (Part No. FKT1106) can be used.

The 12”, 18”, and 24” flexible spring-steel arms are covered with vinyl to protect them from grease, oil, and contaminants that would weaken their holding power. They offer virtually unlimited adjustment possibilities and have long-term holding power.

The transparent portion of these shields is constructed of high-impact-resistant, 3/16”-thick clear polycarbonate. The shield places a barrier between an operator and the flying chips (swarf), sparks, and coolant generated at the point of operation. A variety of flat, angled, and concave shields are available.

FREE-STANDING SHIELD ASSEMBLY

These shields can be used to protect the area between machines, the backside of machines, along aisles, etc.

These free-standing adjustable shield assemblies are available in a wide range of sizes. They are constructed of 3/16”-thick polycarbonate material surrounded by aluminum framing. The shield can easily be adjusted up or down on the stands. The stands are constructed of 2”-square extruded aluminum. Each base includes four holes for permanent mounting to the floor. Four standard sizes are available. Special size shield assemblies are available upon request.

LOCKOUTS

ELECTRICAL PLUG LOCKOUT
PART NO. KYM088
This lockout container can lockout plugs up to 3” wide and 5½” long with a maximum cord diameter of 1⅛”.

The lockout consists of a round container and two cover plates made of a durable and chemically resistant thermoplastic. The cover plates, when used singularly or combined, are locked to produce a universally fitting electrical plug lockout device.

This lockout is bright yellow so it can also serve as a visual warning to other plant personnel.

PLUG HUGGER—PART NO. KYM199
This device is ideal for frequently locked-out cords. It slides over the plug’s blades and locks with a key. It can only be used on standard 125-V, 15A plugs (polarized or nonpolarized) with a hole on both blades.

LOCKOUT HASPS
These lockout hasps are made from 12-gauge steel that is epoxy-coated for superior rust resistance and added dielectric strength. The yellow plastic coating on the lock area is for visibility. These devices accept up to six padlocks with 9/32” maximum shackle diameter.

PART NO. KYM988 1” Diameter Lockout Hasp
PART NO. KYM989 1½” Diameter Lockout Hasp

ELECTRICAL POWER CUTOFF SYSTEM (INTERLOCK)
This interlock assembly can be interfaced into the control system so when the plug is pulled, the machine or equipment becomes inoperable. It includes a two-prong plug, a 24” chain, a receptacle, and an electrical mounting box.

PART NO. KTS518 One-Contact Interlock System With 24” Chain
PART NO. KTS533 Two-Contact Interlock System With 24” Chain

TAGOUTS
These tagouts are 2-7/8” x 5½” x .055” thick, and made of a polyethylene material. They meet the requirements of OSHA 29 CFR 1910.147 for lockout/tagout. The reverse side of each tagout is the same.
SLIDE-OPERATED VALVE
This three-way valve is operated with the manual movement of a slide that opens and closes the valve. This valve shuts off air at the machine and then bleeds off downstream air. It can be locked only in the off position.

EEZ-ON VALVE
This valve shuts off air supply to the machine and bleeds downstream air when the valve is closed. When the valve is open, it gradually allows air into the air system to prevent damage to air components. It can be locked only in the off position. This valve is furnished with a muffler.

SINGLE-PHASE DISCONNECT SWITCH WITH MAGNETIC MOTOR STARTER AND SELF-LATCHING EMERGENCY-STOP BUTTON
This single-phase unit is designed for motors that have built-in overloads. Typical applications for these combinations include smaller crimping machines, grinders, drill presses, and all types of saws.

PART NO. CSS055 (115V, ½ HP MAX.)
The 115V, 15A disconnect switch and nonreversing magnetic motor starter are housed in a NEMA 12 enclosure. Enclosure size is 8” x 6” x 3½”. It includes a self-latching red emergency-stop palm button and a green motor control on push button. It can be used on machines with 115V power and is rated up to ½ HP maximum.

The disconnect switch has a rotary operating handle which is lockable in the off position only. This meets OSHA regulations and ANSI standards.

For machines with 230VAC single-phase motors, a transformer is required to reduce the control circuit voltage to 115VAC in order to comply with NFPA 79. See the RSD series disconnect switches, motor starters, and combinations on pages 93-94.

PART NO. CSF082 (115VAC, 3/4 HP MAX.)
The 115VAC, 20A non-reversing magnetic motor starter, self-latching red emergency-stop palm button, green motor control on push button and red motor control off push button are housed in a NEMA 4 polycarbonate enclosure. Enclosure size is 5” x 5” x 4”. It can be used for machines with 115VAC power and is rated up to 3/4 HP maximum at 115VAC. For machines with 230VAC single-phase motors, a transformer is required to reduce the control circuit voltage to 115VAC in order to comply with NFPA 79. See the RSD series disconnect switches, motor starters, and combinations on pages 92-93.

PART NO. CSF301 (115VAC, 2 HP MAX.)
The 115VAC, 30A non-reversing magnetic motor starter, self-latching red emergency-stop palm button, green motor control on push button and red motor control off push button are housed in a NEMA 12 enclosure. Enclosure size is 8” x 6” x 6”. It can be used for machines with 115VAC power and is rated up to 2 HP maximum at 115VAC. For machines with 230VAC single-phase motors, a transformer is required to reduce the control circuit voltage to 115VAC in order to comply with NFPA 79. See the RSD series disconnect switches, motor starters, and combinations on pages 92-93.
ENCLOSED TRANSFORMERS

These transformers comply with OSHA regulations and ANSI standards and are available for use when the motor start/stop station is remotely located from the starter enclosure, and voltage to these buttons must be 115V or less. These transformers mount directly to the frame of the machine. If the existing motor starter operating coils are a higher voltage (208, 230, 460, 575 V), they must be replaced with a 115V coil when furnishing these transformers. A replaceable fuse is accessible from the outside of the transformer housing.

IEC FUSED DISCONNECT SWITCHES, MAGNETIC MOTOR STARTERS, AND COMBINATIONS

These three-phase disconnect/starters are housed in a NEMA 12 metal enclosure. The enclosure size will vary depending on the motor starter required. These units can be used on machines with 208, 230, 460, or 575 V. They are furnished with an overload relay and have operating coils of 115V, 60 Hz. The disconnect operating handle is lockable in the off position only. These combination units meet OSHA regulations, ANSI standards, and NFPA 79.

To obtain the part number of the motor starter required, please refer to the part numbering chart on the next page.

A remote station is required when using any plain-door starter. To obtain the part number of the remote operator station required, please refer to the part numbering chart on the page 94.

Note: Please furnish the exact motor horsepower, voltage, and full-load amps when ordering any of the disconnects or starters on page 93. This information is usually on the motor nameplate. Voltage can be 208, 230, 460, or 575 V. If other sizes are required, please consult Rockford Systems.
**SELECTING A DISCONNECT, STARTER, OR COMBINATION DISCONNECT/STARTER(S)**

To determine the 9-digit configured part number for a disconnect, starter, or combination disconnect/starter(s) required, follow directions 1-7 below and use the information in the **PART NUMBERING SYSTEM CHART** below.

The first 3 digits for all disconnects, starters, or combination disconnect/starter(s) are RSD.

The 4th digit determines the size of the disconnect switch, if required. Zero (0) indicates no disconnect switch provided.

The 5th digit determines the type of the main motor starter and/or 2nd motor starter. Zero (0) indicates no starters.

The 6th digit determines the size of the main motor starter. Zero (0) indicates no main motor starter.

The 7th digit determines the size of the 2nd motor starter. Zero (0) indicates no 2nd motor starter.

The 8th digit (if required) determines the configuration and location of the operator controls.

The 9th digit determines if a transformer and/or wiring is required.

**SELECTING A REMOTE OPERATOR STATION**

To determine the 8-digit configured part number for a remote operator station required, follow directions 1-3 below and use the information in the PART NUMBERING SYSTEM CHART below.

The first 3 digits determine the orientation of the remote operator station.
Digits 4 through 7 determine motor operators. Zero (0) indicates no operator(s).
The 8th digit (if required) determines the 2nd motor operators.

DISCONNECT SWITCHES, MOTOR STARTERS, AND ACCESSORIES
REMOTE OPERATOR STATIONS

PART NO. HOS4000
This 4½" x 3½" x 3" station has a self-latching red emergency-stop palm button in a NEMA 12 metal enclosure. To reset this button, turn it to the right.

PART NO. VOS2000
(FOR USE WITH NONREVERSING MOTOR STARTERS)
This 6¾" x 3½" x 3" station has a motor on push button and a self-latching red emergency-stop palm button in a NEMA 12 metal enclosure.

PART NO. HOS4201
(FOR USE WITH REVERSING MOTOR STARTERS)
This 3½" x 10½" x 3" station has a motor jog/run selector switch, forward and reverse push buttons, and a self-latching emergency-stop palm button in a NEMA 12 metal enclosure.

PART NO. VOS1000
(FOR USE WITH NONREVERSING MOTOR STARTERS)
This 6¾" x 3½" x 3" station has motor on and stop push buttons in a NEMA 12 metal enclosure.

PART NO. VOS1000
(FOR USE WITH REVERSING MOTOR STARTERS)
This 8¾" x 3½" x 3" station has a motor forward/reverse selector switch, a motor on push button, and a self-latching red emergency-stop palm button in a NEMA 12 metal enclosure.

PART NO. VOS2100
(FOR USE WITH REVERSING MOTOR STARTERS)
This 8¾" x 3½" x 3" station has a motor forward/reverse selector switch, a motor forward reversible selector switch, and a self-latching red emergency-stop palm button in a NEMA 12 metal enclosure.

PART NO. PB5R00-01—
Self-Latching Emergency-Stop Mushroom-Head Push Button

Yellow Emergency-Stop Nameplate (22.5 mm hole)

PART NO. CTC550—
Push/Pull to Release Emergency-Stop Push Button

PART NO. CTM548—
Yellow Emergency-Stop Nameplate (30 mm hole)
The signs offered in this catalog are .055” thick linear polyethylene. They are semi-rigid plastic and are capable of withstanding a temperature range of -60° to 130° F. They are resistant to tears and may be mounted with nails, rivets, screws, bolts, nylon lock-straps, double-face adhesive tape, etc. Each sign is protected from fading, chipping, scratching, weather extremes, physical abuse, grease, oil, moisture, chemicals and acids. These signs do not rust, dent, or corrode. They do not curl up or rip and are lightweight and easy to handle.

OSHA STANDARDS

OSHA 29 CFR 1910.212 and a portion of 1910.219 are included in this catalog for use as a reference when determining safety requirements for bringing cutting and turning machines into compliance. Please note that 29 CFR 1910.147 (lockout/tagout) is not included here but it is an OSHA standard an employer must comply with for all machines and equipment.

29 CFR 1910.212 GENERAL REQUIREMENTS FOR ALL MACHINES

(a) Machine guarding — (1) Types of guarding. One or more methods of machine guarding shall be provided to protect the operator and other employees in the machine area from hazards such as those created by point of operation, ingoing nip points, rotating parts, flying chips and sparks. Examples of guarding methods are barrier guards, two-hand tripping devices, electronic safety devices, etc.

(2) General requirements for machine guards. Guards shall be affixed to the machine where possible and secured elsewhere if for any reason attachment to the machine is not possible. The guard shall be such that it does not offer an accident hazard in itself.

(3) Point of operation guarding. (i) Point of operation is the area on the machine where work is actually performed upon the material being processed.

(ii) The point of operation of machines whose operation exposes an employee to injury, shall be guarded. The guarding device shall be in conformity with any appropriate standards therefor; or, in the absence of applicable specific standards, shall be so designed and constructed as to prevent the operator from having any part of his body in the danger zone during the operating cycle.

(iii) Special hand tools for placing and removing material shall be such as to permit easy handling of material without the operator placing a hand in the danger zone. Such tools shall not be in lieu of other guarding required by this section, but can only be used to supplement protection provided.

(iv) The following are some of the machines which usually require point-of-operation guarding:

(a) Guillotine cutters.
(b) Shears.
(c) Alligator shears.
(d) Power presses.
(e) Milling machines.
(f) Power saws.
(g) Jointers.
(h) Portable power tools.
(i) Forming rolls and calenders.

(4) Barrels, containers, and drums. Revolving drums, barrels and containers shall be guarded by an enclosure which is interlocked with the drive mechanism, so that the barrel, drum or container cannot revolve unless the guard enclosure is in place.

(5) Exposure of blades. When the periphery of the blades of a fan is less than seven (7) feet above the floor or working level, the blades shall be guarded. The guard shall have openings no larger than one-half (½) inch.

(b) Anchoring fixed machinery. Machines designed for a fixed location shall be securely anchored to prevent walking or moving.

29 CFR 1910.219 MECHANICAL POWER-TRANSMISSION APPARATUS

(b) Prime-mover guards—(1) Flywheels. Flywheels located so that any part is seven (7) feet or less above floor or platform shall be guarded in accordance with the requirements of this subparagraph:

(i) With an enclosure of sheet, perforated, or expanded metal, or woven wire;

(ii) With guard rails placed not less than fifteen (15) inches nor more than twenty (20) inches from rim. When flywheel extends into pit or is within 12 inches of floor, a standard toeboard shall also be provided;

(iii) When the upper rim of flywheel protrudes through a working floor, it shall be entirely enclosed or surrounded by a guardrail and toeboard.

(iv) For flywheels with smooth rims five (5) feet or less in diameter, where the preceding methods cannot be applied, the following may be used: a disk attached to the flywheel in such manner as to cover the spokes of the wheel on the exposed side and present a smooth surface and edge, at the same time providing means for periodic inspection. An open space, not exceeding four (4) inches in width, may be left between the outside edge of the disk and the rim of the wheel if desired, to facilitate turning the wheel over. Where a disk is used, the keys or other dangerous projections not covered by disk shall be cut off or covered. This subdivision does not apply to flywheels with solid web centers.

(v) Adjustable guard to be used for starting engine or for running adjustment may be provided at the flywheel of gas or oil engines. A slot opening for jack bar will be permitted.

(vi) Wherever flywheels are above working areas, guards shall be installed having sufficient strength to hold the weight of the flywheel in the event of a shaft or wheel mounting failure.

Note: This is not the entire content of 29 CFR 1910.219.

This catalog does not cover all aspects of a safety program. There are many publications on the subject of safety. Please see page 5 for a listing of safety sources.
Safeguarding Devices is a comprehensive catalog that features a wide-range of safeguarding devices and other safety-related products for updating hazardous machinery and processes. These devices are designed for point-of-operation safeguarding as well as for auxiliary guarding and large work-envelope safeguarding.

Some of the products in this catalog include presence-sensing devices, area scanning devices, tower light assemblies, Detect-A-Finger® drop-probe devices, and pressure sensitive safety mats. These products can be used to safeguard fabricating machines, metal-cutting machines, material handling equipment, woodworking machines, and more.

All products in this catalog are intended and designed to meet the requirements of OSHA and ANSI safety standards.

At Rockford Systems, we are experts at machine guarding because it has been our sole focus for over 50 years. We stand committed to the prevention of injuries and fatalities. Our mission is to enhance the long-term health and quality of life of workers in high-risk occupations, while improving the bottom line of the organizations we serve by increasing compliance, reducing risk, lowering costs and improving productivity.

PRESENCE-SENSING DEVICES

INTRODUCTION

Presence-sensing devices are available as infrared point-of-operation light curtains, infrared perimeter multiple light beam devices, infrared single-beam devices, or safety laser scanners. Light curtains used for point-of-operation safeguarding have close channel spacing to protect fingers and hands. Perimeter light curtains have wider channel spacing to detect larger parts of the body. Perimeter, multi-beam, and single-beam devices are designed specifically for perimeter safeguarding. Safety laser scanners are designed for area, access, and point-of-operation safeguarding.

There are many safety requirements that must be met before light curtains can be installed as point-of-operation safeguards. These requirements are located in OSHA 29 CFR 1910.217 and the ANSI B11-series safety standards for machine-tool safety. We have printed the following paragraphs for your convenience.

(c)(3)(i) Point-of-operation devices shall protect the operator by:

(a) Preventing and/or stopping normal stroking of the press if the operator’s hands are inadvertently placed in the point of operation;
(b) The devices may not be used on machines using full revolution clutches.
(c)(3)(ii) A presence sensing point-of-operation device shall protect the operator as provided in paragraph (c)(3)(i)(a) of this section, and shall be interlocked into the control circuit to prevent or stop slide motion if the operator’s hand or other part of his body is within the sensing field of the device during the downstroke of the press slide.

(a) The devices may not be used on machines using full revolution clutches.
(b) The devices may not be used as a tripping means to initiate slide motion, except when used in total conformance with paragraph (h) of this section. (See OSHA safety standards for details.)
(c) The device shall be constructed so that a failure within the system does not prevent the normal stopping action from being applied to the press when required, but does prevent the initiation of a successive stroke until the failure is corrected. The failure shall be indicated by the system.
(d) Muting (bypassing of the protective function) of such device during the upstroke of the press slide is permitted for the purpose of parts ejection, circuit checking, and feeding.
(e) The safety distance (Ds) from the sensing field to the point of operation shall be greater than the distance determined by the following formula:

\[ D_s = K (Ts + Tc + Tr + Tspm) + Dpf \]

where:

- \[ K = 63 \text{ inches/second (hand speed constant)} \]
- \[ Ts = \text{Stop time of equipment measured at the final control element} \]
- \[ Tc = \text{Response time of the control system} \]
- \[ Tr = \text{Response time of the presence-sensing device and its interface} \]
- \[ Tspm = \text{Additional time allowed for the stopping performance monitor to compensate for variations in normal stopping time} \]
- \[ Dpf = \text{The added distance due to the depth penetration factor.} \]

Note: If the channel blanking feature is used on light curtains, additional safety distance must be enforced based on the number of channels blanked.

The following is a list of safeguarding devices that could be applied using the above safety distance formula. For more details, see ANSI B11.1-2009.

1. Interlocked barrier guards
2. Two-hand control devices
3. Two-hand trip devices
4. Single control safeguarding devices
5. Electro-optical presence-sensing devices
6. RF (radio-frequency) presence-sensing devices
7. Safety mat devices
8. Safety edge device

MINIMUM SAFETY DISTANCE

The minimum safety distance, which is one of the considerations listed, is defined in ANSI as the minimum distance from the light curtain’s plane of light to the closest hazard or danger point where the operator could reach into the hazard.

This minimum safety distance is based on the stopping ability of the machine and a hand speed constant. When the minimum safety distance is calculated, several other factors must be taken into account which are not included in the OSHA formula. These factors include the total system response time including the light curtain, the minimum object sensitivity of the presence-sensing device, and the additional time for brake monitoring. The total system response time includes the stopping time of the machine under worse case conditions, response time of the control system, response time of the presence-sensing device as stated by the manufacturer, the response time of the interface, and, if applicable, additional time allowed for the brake monitor to compensate for variations in normal stopping time.

The depth penetration factor (Dpf), which is based on the light curtain’s MOS (minimum object sensitivity), is part of the formula.

The following formula is used to compute the minimum safety distance (Ds) on mechanical power presses to meet the ANSI (American National Standards Institute) B11.1 standard for press safety:

\[ D_s = K (Ts + Tc + Tr + Tspm) + Dpf \]

The added distance due to the depth penetration factor. Note: If the channel blanking feature is used on light curtains, additional safety distance must be enforced based on the number of channels blanked.
PORTABLE STOP-TIME MEASUREMENT (STM) DEVICE

The stop-time measurement (STM) device measures the time it takes a machine to stop after a signal is given. It is mainly used on reciprocating (stroking or cycling) machines, such as mechanical or hydraulic presses and press brakes. With optional accessories, it can also be used on machines that rotate, such as lathes, mills, and drills.

Industry uses this type of device to determine the stopping time of a machine before installing safeguarding devices such as a two-hand control or a presence-sensing device. The stopping time measured by the STM device during the hazardous portion of the cycle is used in the OSHA (Occupational Safety and Health Administration) or ANSI (American National Standards Institute) formulas to calculate the safety distance. The safety distance is then used to establish the location of the safeguarding device in relation to the nearest hazard. This device can also be used to periodically check the machine’s stopping time to ensure that the current safety distance corresponds to the current condition of the machine’s stopping ability.

SPECIFICATIONS:

Electronics

Display
Description..............................4 digit, 14 segment, 1/4” red LED
Stop Time..............................................0-9999 milliseconds
Safety Distance.........................................0-999.9 inches
Automatic Decimal.................................Yes
Lead Zero Blanking.................................Yes
Accuracy..............................................±1%
Power Source .....................................115VACor internal battery
Battery Type..........................................6 V, sealed lead acid
Operating Time......................................10 hours (full charge)
Recharge Time.......................................8 hours
Battery Charger.....................................Contained

Weight.....................................3 lb

Position/Velocity Transducer
Material.................................Aluminum with baked enamel finish
Dimensions.................................5¼” L x 2¼” D x 4¼” H
Weight.....................................1.6 lb
Cable stroke.................................49”
PORTABLE STOP-TIME MEASUREMENT (STM) DEVICE

When using this STM device, the display gives both the stopping time of the machine in milliseconds (thousandths of a second), and the calculated safety distance in inches. The safety distance is based on the hand speed constant of 63 inches (1.6 meters) per second. For mechanical power presses, the OSHA formula multiplies the hand speed constant by the stopping time of the machine at 90° of crankshaft rotation. When using this formula, the reaction time of either ergonomic (capacitive) palm buttons or a presence-sensing device should be added to the stopping time to calculate the proper safety distance. Please refer to the formula found in the ANSI B11.1 standard for mechanical power presses.

This STM device is also used by federal and state OSHA compliance officers, insurance company loss-control engineers, and safety training personnel to determine if proper safety distances are being used for the existing safeguarding method.

The portable design makes the STM very easy to use. A programmed stop signal is provided, which releases or actuates a button or other operator-controlled device on the machine during the hazardous portion of the cycle. If a machine has a presence-sensing device, the plane of light can be interrupted with the furnished flag, which sends a signal to stop the machine.

This device consists of three major components:

1. The meter which is the processor containing the electronics and display.
2. The position/velocity transducer which detects motion and provides the programmed output signal to stop the machine.
3. The hand-held actuator which automatically releases or pushes a button or other device on the machine. It is also used to operate the flag when presence-sensing devices are used as the safeguarding method.

Other STM components provided with this device are the presence-sensing flag, cable extension set, legs, plunger extension, and instruction manual.

ORDERING INFORMATION

Part No. DCL100—Complete STM in a carrying case including meter, transducer, cable extension set, hand-held actuator, presence-sensing flag, legs, plunger extension, and instruction manual.

Optional Accessories

Part No. DCL101—Remote tachometer assembly (for reciprocating machines that stop beyond bottom or top, and for machines with relatively slow rotating or lineage motion)

Note: Requires DCL102 (see below)

Part No. DCL102—One NO manual start switch

### Selection Guide for Point-of-Operation and Perimeter (Work-Envelope) Safeguarding

This chart has been put together to make selecting the proper safeguarding system for your application easy. Begin by determining the type of application that requires safeguarding. Choose the point-of-operation system, perimeter system, single beam system, or area scanning device that fits your application. If at any time you have questions, please call us at 1-800-922-7533.

POIINT-OF-OPERATION LIGHT CURTAIN SYSTEMS

EZ-SCREEN LIGHT CURTAIN SYSTEM FEATURES

- Meets industry OSHA, ANSI, UL, IEC, and EN safety standards 14 and 30 mm resolutions
- Field of coverage from 11.8” to 70.9” (300 mm to 1800 mm)
- Scanning range up to 59’ (18 m)
- 2 solid-state OSSD (output signal switching device) outputs—24-V PNP outputs
- Quick response times
- Strobe-light and weld-flash immunity
- Compact light bar housing—1.78” x 1.42” (45.2 x 36.0 mm)
- Transmitter and receiver cable lengths from 15’ to 100’ (4.5 to 30 m)
- 7-segment alignment and diagnostics display
- Two-piece design with external device monitoring (EDM)
- Cascading—up to 4 pairs and of different lengths

This photoelectric presence-sensing system (light curtain) is designed to meet safety standards for protecting operating personnel from point-of-operation machine hazards. The EZ-Screen system operates as a stand-alone system to be interfaced into an existing machine control, or a generic interface control is available (see page 14).

The EZ-Screen system consists of a transmitter and receiver. The transmitter consists of a series of LEDs (light-emitting diodes) which transmit modulated infrared light to the receiver unit. The receiver consists of a corresponding array of photo-diodes that are automatically synchronized with the transmitter LEDs. The EZ-Screen system can be mounted vertically, horizontally, or on any angle depending on the application. The only requirement is that the transmitter must align with the receiver when these units are installed. This system is also cascadable up to four systems. The cascadable pairs can be any length, any number of beams, or have different resolutions as long as each transmitter matches its own receiver.

The EZ-Screen presence-sensing system provides a protective, durable plane of light formed by the aligned transmitter and receiver cells. Any interruption of this plane of light by an object equal to or larger than the MOS (minimum object sensitivity) initiates an output signal to the machine control system. This output causes the machine to stop or does not allow a cycle until the blockage is removed.
EZ-SCREEN LIGHT CURTAIN SYSTEM FEATURES (CONTINUED)

The EZ-Screen system is designed in a way that if a component should fail, a total system shutdown results. This is achieved through redundant self-checking circuitry, which compares the actual system operation with that of a redundant setup. Upon detection of any deviation from the expected status, a shutdown condition occurs.

The plane-of-light portion of the system is formed by a series of high-quality individual optical lenses on every transmitter and receiver channel. This assures the optimal signal-to-noise ratio and allows operation in harsh, oily, and dirty environments. Individual channel lenses create a column of light between each of the active transmitter and receiver channels. The creation of a column of light between transmitter and receiver is called light collimation. Light collimation is necessary to ensure that the infrared light moves from the transmitter to the receiver in a controlled beam that maximizes its efficiency. Additionally, the lens on each receiver channel minimizes the possibility of the infrared light bouncing off shiny objects and fooling the receiver.

The light bars are equipped with status indicators—LEDs and a 7-segment display. These status indicators are helpful when aligning the light curtain and when determining the cause of an interruption in the EZ-Screen system. The LEDs illuminate and the display indicates alphanumeric error messages when a channel is interrupted, out of alignment, configured incorrectly, etc.

The EZ-Screen light curtain system modulates each of its LED light sources in a specially coded manner. This modulation virtually eliminates ambient light interference. The light curtain electronically sequences its individual LED transmitters and photo-transistor receivers at a fast rate that prevents any light interference between individual transmitter/receiver sections. This also provides maximum stability and ease of alignment.

STATUS INDICATOR LIGHTS
A variety of status indicator lights are clearly visible on the front panel of each transmitter and receiver. Red, green, and yellow lights display the operating status, configuration error codes, and blocked beams. A diagnostic display indicates alphanumeric error messages when a channel is interrupted, out of alignment, configured incorrectly, blocked, etc.
EZ-SCREEN RESPONSE TIMES

The response time of these light curtains varies depending on their size (see the chart below). The response time is the length of time that elapses between the interruption of the light beam and the output signal. Response time includes the reaction time of the output device(s) (i.e., relays), and is specified in milliseconds.

These light curtains are designed to meet UL and CSA standards and also have full PSDI (presence-sensing-device initiation) capability. This means that the light curtain can be used to start the cycle of the machine while at the same time it can be safeguarding the machine. For further information on PSDI, please see OSHA 29 CFR 1910.217 (h) and ANSI B11.1, B11.2, B11.3, and B11.19.

SELECTING A NONCASCADING EZ-SCREEN LIGHT CURTAIN

To determine the 9-digit configured part number for a noncascading light curtain required, follow the directions and use the information in the PART NUMBERING SYSTEM CHART below.

1. The first 3 digits for all EZ-Screen light curtain pairs are LCB.
2. The 4th digit determines the MOS (minimum object sensitivity) and OPR (operating range).
3. The 5th and 6th digits determine the field of coverage.
4. The 7th digit determines the selection of remote keyed fixed blanking.
5. The 8th digit indicates the length of the transmitter cable.
6. The 9th digit indicates the length of the receiver cable (can be a different length from the transmitter cable).

The sample shown, Part No. LCB-3-24-1-5-7, is an EZ-Screen light curtain pair with 1.18" (30 mm) minimum object sensitivity, 1-59' (18 m) operating range, 23.6" (600 mm) field of coverage, remote fixed blanking, a 50' transmitter cable, and a 75' receiver cable.

<table>
<thead>
<tr>
<th>MOS (MINIMUM OBJECT SENSITIVITY)</th>
<th>OPR (OPERATING RANGE)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 — 0.55&quot; (14 mm)</td>
<td>19.68' (6 m)</td>
</tr>
<tr>
<td>3 — 1.18&quot; (30 mm)</td>
<td>59' (18 m)</td>
</tr>
</tbody>
</table>

FIELD OF COVERAGE

| 12 — 11.8" (300 mm) |
| 18 — 17.7" (450 mm) |
| 24 — 23.6" (600 mm) |
| 30 — 29.5" (750 mm) |
| 35 — 35.4" (900 mm) |
| 41 — 41.3" (1050 mm) |
| 47 — 47.2" (1200 mm) |
| 53 — 53.1" (1350 mm) |
| 59 — 59" (1500 mm)   |
| 65 — 65" (1650 mm)   |
| 71 — 70.9" (1800 mm) |

RECEIVER CABLE W/PLUG

| 0 — No cable |
| 1 — 15' (4.5 m) |
| 2 — 25' (7.6 m) |
| 5 — 50' (15.2 m) |
| 7 — 75' (22.8 m) |
| 9 — 100' (30.4 m) |

TRANSMITTER CABLE W/PLUG

| 0 — No cable |
| 1 — 15' (4.5 m) |
| 2 — 25' (7.6 m) |
| 5 — 50' (15.2 m) |
| 7 — 75' (22.8 m) |
| 9 — 100' (30.4 m) |

REMOTE FIXED BLANKING SWITCH

| 1 — Yes—includes 1' (.31 m) connection cable |
| 2 — No                                     |

Four (4) end mount swivel brackets are included with each light bar pair for mounting.
Two (2) additional center mounting brackets are included with each light bar pair with a field of coverage of 47 and up.

REMOTE FIXED BLANKING SWITCH

A remote fixed blanking switch is provided when the remote fixed blanking switch option is chosen in the part numbering chart above. This remote blanking switch is used in place of the DIP switches on the receiver when frequent configuration of fixed blanking is needed. A 1' connection cable, two (2) mounting brackets, and two (2) keys are supplied with each remote switch.
SELECTING THE FIRST PAIR IN A CASCADING EZ-SCREEN LIGHT CURTAIN SYSTEM

To determine the 9-digit configured part number for the first pair in a cascading light curtain system, follow the directions and use the information in the PART NUMBERING SYSTEM CHART below.

1. The first 4 digits for the first pair in a cascading light curtain system are LCBC.
2. The 5th digit determines the MOS (minimum object sensitivity) and OPR (operating range).
3. The 6th and 7th digits determine the field of coverage.
4. The 8th digit determines the length of the transmitter cable. NOTE: This is required for the first pair of cascading light bar pairs only.
5. The 9th digit determines the length of the receiver cable (can be a different length from the transmitter cable). NOTE: This is required for the first pair of cascading light bar pairs only.

SAMPLE—FIRST IN CASCADE SYSTEM

The sample shown, Part No. LCBC-3-18-1-2, is the first pair in the cascading system. It has 1.18" (30 mm) minimum object sensitivity, 1-59’ (18 m) operating range, 17.7" (450 mm) field of coverage, a 15’ transmitter cable, and a 25’ receiver cable.

Four (4) end mount swivel brackets are included with each light bar pair for mounting.
Two (2) additional center mounting brackets are included with each light bar pair with a field of coverage of 47 and up.

NOTE: Use the chart on the next page to configure an additional part number for each of the 2nd, 3rd, and/or 4th pair in the cascading system. A maximum of four (4) light bar pairs may be cascaded, and they can be of different lengths.
SELECTING THE 2ND, 3RD, AND/OR 4TH PAIR IN A CASCADING EZ-SCREEN LIGHT CURTAIN SYSTEM

To determine the 9-digit configured part number for the 2nd, 3rd, and/or 4th pair in a cascading light curtain system, follow the directions and use the information in the PART NUMBERING SYSTEM CHART below.

1. The first 4 digits for the 2nd, 3rd, and/or 4th pair in a cascading light curtain system are LCBC.
2. The 5th digit determines the MOS (minimum object sensitivity) and OPR (operating range).
3. The 6th and 7th digits determine the field of coverage.
4. The 8th digit determines the length of the connecting cables between the transmitters.
5. The 9th digit determines the length of the connecting cables between the receivers.

The sample shown, Part No. LCBC-3-24-C-C, is the second pair in the cascading system. It has 1.18” (30 mm) minimum object sensitivity, 1-59’ (18 m) operating range, 23.6” (600 mm) field of coverage, and a 3’ transmitter connecting cable with a 3’ receiver connecting cable.

NOTE: Use the chart above to configure a part number for EACH additional cascading light bar pair for the 2nd, 3rd, and/or 4th pair in the cascading system. A maximum of four (4) light bar pairs may be cascaded, and they can be of different lengths.
REMOTE OPERATOR STATIONS
Remote operator stations are available that can be used in conjunction with an interface when a plain door enclosure or loose interface components are chosen. These remote operator stations are available with an off/on keyed selector switch, a light curtain reset button, or an off/on keyed selector switch and reset button. Each remote operator station is furnished in a steel enclosure.

LASER ALIGNMENT TOOL—PART NO. LAT-1
A laser alignment tool is available to aid in the alignment of any point-of-operation light curtain system. It is particularly useful with applications involving mirrors.

The laser alignment tool includes a 9-volt battery, a mounting clip, and has a built-in circular bubble level. This alignment tool is to be used for set up only.
PERIMETER LIGHT BEAM SYSTEM

The perimeter light beam system is designed to meet safety standards for one-sided or multi-sided hazardous area and access protection. It can be used for safeguarding robotic work cells, automatic machinery work envelopes, assembly lines, and other manufacturing work cells.

FEATURES

- Meets industry OSHA, ANSI, UL, IEC, and EN safety standards
- Operating ranges: Short—2.6’ to 65’ (.8 to 20 m)  
  Long—49’ to 230’ (15 to 70 m)
- Number of beams—2, 3, or 4
- Beam separation—12” to 23” (300 mm to 584 mm)
- 24 ms response time
- Strobe-light and weld-flash immunity
- Transmitter and receiver cable lengths up to 100’ (30.5 m)
- Restart interlock
- External device monitoring (EDM)
- LED 7-segment alignment and diagnostics display

The perimeter light beam system consists of a transmitter and receiver. Each is encased in a rigid, aluminum die-cast housing which makes them very durable. Communication between the transmitter and receiver is accomplished optically; no external controller is required.

An invisible infrared beam of light is formed between the transmitter and receiver. Interruption of this beam of light sends a stop signal to the machine’s control. This signal is designed to stop hazardous machine motion or prevent the initiation of machine motion.

Mirrors increase the coverage of the safeguarded area. Two sides of a hazardous area can be safeguarded with the use of one perimeter light beam system and one mirror. Three sides of a hazardous area can be safeguarded by using one perimeter light beam system and two mirrors. See pages 31-32 for information about mirrors.

The perimeter light beam system is delivered ready for operation. Configuration settings are accessible from the front of the beams and can be changed while the system remains mounted.

SELECTIONG PERIMETER LIGHT BEAM SYSTEM

To determine the 8-digit configured part number for the perimeter light beam system required, follow the directions below and use the information in the PART NUMBERING SYSTEM CHART below.

1. The first 3 digits determine the choice of a short range perimeter system or a long range perimeter system.
2. The 4th, 5th, and 6th digits determine the number of beams and beam separation.
3. The 7th digit determines the length of the transmitter cable.
4. The 8th digit determines the length of the receiver cable (can be a different length from the transmitter cable).

SAMPLE

The sample shown, Part No. PBS-342-1-2, is a short range perimeter light beam system. It has three beams with 21.0" (533 mm) of beam separation, 42.0" (1066 mm) field of coverage, with a 15' (4.5 m) transmitter cable and a 25' (7.6 m) receiver cable.

5 — 50' (15.2 m)
7 — 75' (22.8 m)
9 — 100' (30.4 m)

Four (4) end mount swivel brackets are included with each perimeter light beam system for mounting.

LASER ALIGNMENT TOOL—PART NO. LAT-1

A laser alignment tool is available to aid in the alignment of any perimeter light curtain system. It is particularly useful with applications involving mirrors.

The laser alignment tool includes a 9-volt battery, a mounting clip, and has a built-in circular bubble level. This alignment tool is to be used for setup only.
SINGLE BEAM SYSTEM

The single beam system is designed specifically for perimeter or auxiliary safeguarding. It can be used for safeguarding hazardous areas around machines and processes such as press feeding equipment, robotic work cells, automatic machinery work envelopes, assembly lines, conveyors, palletizers, stackers, and plastic-injection molding machines.

FEATURES

- Meets industry OSHA, ANSI, UL, IEC, and EN safety standards
- Operating ranges:
  - Short—2.6’ to 65’ (.8 to 20 m)
  - Long—49’ to 230’ (15 to 70 m)
- Number of beams—1
- Strobe-light and weld-flash immunity
- 24 ms response time
- Diagnostics with 7-segment display
- Optional external device monitoring (EDM)

The single beam system consists of a transmitter and a receiver, each with strong, durable aluminum housing. When aligned and mounted at the proper safety distance, these sensors transmit an invisible beam of light across the entryway to the hazardous area. Interruption of this light beam sends a stop signal to the machine’s control. This signal is designed to stop hazardous machine motion or prevent the initiation of machine motion. The single beam system can be used in conjunction with mirrors to increase the coverage of the safeguarded area.

SINGLE BEAM TRANSMITTER AND RECEIVER DIMENSIONS
SELECTING A SINGLE BEAM SYSTEM

To determine the 6-digit configured part number for the single beam system required, follow the directions below and use the information in the PART NUMBERING SYSTEM CHART below.

1. The first 3 digits determine the choice of a short range single beam system or a long range single beam system.
2. The 4th digit determines the number of beams which will always be one (1).
3. The 5th digit determines the length of the transmitter cable.
4. The 6th digit determines the length of the receiver cable (can be a different length from the transmitter cable).

The sample shown, Part No. SBL-1-2-5, is a long range single beam system with one (1) beam. It has a 25’ (7.6 m) transmitter cable and a 50’ (15.2 m) receiver cable.

OFF/ON REMOTE OPERATOR STATION—PART NO. LLD1236
An off/on remote operator station is available that is used in conjunction with an interface when a plain door enclosure or loose interface components are chosen. This remote operator station includes an off/on keyed selector switch in a steel 31/2” x 31/4” x 23/4” enclosure.

LASER ALIGNMENT TOOL—PART NO. LAT-1
A laser alignment tool is available to aid in the alignment of any single beam system. It is particularly useful with applications involving mirrors.

The laser alignment tool includes a 9-volt battery, a mounting clip, and has a built-in circular bubble level. This alignment tool is to be used for set up only.

TOWER LIGHT BRACKET— CMC569M

An optional mounting bracket for self-contained tower light assemblies is available for mounting the tower light in a convenient location. The right angle bracket is made of 12-ga. stainless steel and has curved mounting slots for versatility and orientation.

TOWER LIGHT ASSEMBLY CONTROL BOX—LLD1631

The tower light interface box provides a convenient means of mounting and wiring the tower light. The LLD1631 standard box comes with enough terminals to accommodate five (5) lights or four (4) lights with an alarm in the tower light assembly. This control box is approximately 8” x 6” x 6”.

Inside View of Tower Light Assembly Control Box
NO-GO INDICATOR LIGHT

Most point-of-operation light curtains will not detect workpieces that present a profile of 1/4" or less. However, if the workpiece profile becomes bowed enough to be seen in the plane of light, it will be detected. On press brake operations, the machine will not start a stroke because the workpiece quite often protrudes through the plane of light and is detected. This becomes frustrating for operators because they have to look to the right or to the left for the red and green indicator lights on the transmitter or receiver to determine if the obstruction is detected.

To avoid frustrating the operator, a large red no-go indicator light can be installed on the slide and in the peripheral sight of the operator. This light allows the operator to hold the workpiece in the correct position. At the same time, the no-go light will let them know if their hands or the workpiece is being detected by the light curtain. In some cases, the red no-go indicator light can be used to avoid channel blanking.

The red no-go indicator light has a low-profile design. It is protected from workpieces which bend into the light, and is easily wired into existing light curtain systems.

The no-go indicator light includes the light, the mounting box, and instructions on how to wire it into the light curtain control system.

OPTIONAL MOUNTING BRACKETS FOR POINT-OF-OPERATION LIGHT CURTAIN SYSTEMS—PART NO. EZA-MBK-20

These optional mounting brackets are for use with the point-of-operation light curtain systems on pages 8-14. These brackets are designed to mount point-of-operation light curtain systems to engineered/slotted aluminum framing (for example, Rockford Systems’ Ex-Al™ products). Set of two (2).
SAB-A (SWING-AWAY WITH ADJUSTABLE GUARDS) AND SAB-NA (SWING-AWAY WITH NONADJUSTABLE GUARDS) MOUNTING BRACKETS

Swing-away light curtain mounting brackets with guards are ideal for many machines, including gap-frame presses and press brakes, when the light curtain must be swung out of the way for setup, die changes, or maintenance. The light curtain transmitter and receiver are easily aligned when they are swung back into the machine operating position. The 2” square extruded-aluminum brackets include side barrier guards as shown. The nonadjustable portion of these guards can be constructed of black or yellow mesh (1/2” square, 16 gauge), or clear polycarbonate (3/16”). The lower portion of the barrier guard can be constructed of adjustable, black-oxidized steel hairpins. This allows for feeding of stock, location of chutes, etc., on the sides of the point of operation.

These guards incorporate a hinge assembly on the corner. This allows the light curtain to be swung out. This assembly can also be used to adjust the light curtain panel forward and backward to adjust for safety distance. A built-in locking pin in this assembly holds the panel in place.

Swing-away brackets and barrier guards are built to specifications and measurements provided. See the next page for the appropriate SAB-A or SAB-NA measurement form.
SWING-AWAY MOUNTING BRACKET SPECIFICATIONS

SAB-A
(WITH ADJUSTABLE GUARDS)

SAB-NA
(WITH NONADJUSTABLE GUARDS)

Note: B + C dimension includes safety distance. Stopping time of the machine must be determined to establish the safety distance. Please consult the factory if assistance is needed.

Select the appropriate SAB (swing-away bracket) for your application. If adjustability is required in the lower portion of the barrier guard section, select the mounting bracket SAB-A. If adjustability is not required, select the mounting bracket SAB-NA.

Please complete one of the measurement forms (see page 27-29) when ordering these brackets. The A, B, C, D, and E dimensions will be determined from the measurements supplied. Check the material type for the sides and rear panels below.

Measured By ____________________________________________

Determine which mounting brackets are required: SAB-A (with adjustable barrier guards) or SAB-NA (with nonadjustable barrier guards). Check the bracket type required and complete measurements for the machine where brackets will be applied.

☐ SAB-A*
☐ SAB-NA*

PRESS APPLICATION

Top View

A: Enter dimensions from mounting point on press frame to inside of swing-away mounting bracket. (Be sure bracket extending forward will clear bolster and any obstruction on the side of the press frame.)

B: Enter dimension from front side of machine frame mounting bracket to front edge of bolster plate (assuming nearest pinch point to operator is at the front edge of bolster).

C: Enter the minimum safety distance determined by the safety distance formula. Stopping time of the press must be determined to establish safety distance.

D: Enter the panel height for the guard on the left and right side of machine.

Left ________”  Right ________”

Note: The light curtain mounting extrusion will be a minimum of 8” longer than the light curtain field of coverage.

E: If roof section(s) are required, enter E dimension(s) (height) and provide length of roof section(s):

Left ________”  Right ________”

F: If floor section(s) are required, enter F dimension(s) (height) and provide length of floor section(s):

Left ________”  Front ________”  Right ________”

G: If hairpins are required on side panel extending upward, enter G dimension (height) above the guard to the flywheel cover and provide length ________”.

H: Height from floor to top of bolster.

I: Maximum feedline height (used to determine hairpin length if adjustable brackets).

Notes:

* 1/2” square black mesh will be furnished in the nonadjustable portion of the assembly unless otherwise specified in Notes section above.

Precautions should be taken when applying light curtains for point-of-operation safeguarding. Be sure that someone cannot pass through or stand undetected between the plane of light and the hazard when a light curtain is mounted in a vertical position. If a light curtain must be mounted in this manner due to the safety distance requirements or because of the configuration of the machine, be sure that supplemental safeguarding is provided to safeguard this pass-through area. Examples of supplemental safeguarding include a horizontally mounted light curtain, single-beam devices, guards, or pressure-sensitive safety mats on the floor.

PRESS BRAKE APPLICATION

MEASURING INSTRUCTIONS

Check type of press brake:

☐ Mechanical
☐ Air Clutch
☐ Other

Size of light curtain: _______"

A: Enter dimensions from mounting point on machine frame to inside of swing-away bracket. (Be sure bracket extending forward will clear slide.)

Note: Left and right side dimensions may be different due to an extension on one end of the slide.

B: Enter dimension from front side of machine frame mounting bracket to front of slide or bed.

Note: Left and right side dimensions may be different due to available mounting surfaces on side of machine.

C: Enter the minimum safety distance determined by the safety distance formula. Stopping time of the machine must be determined to establish safety distance.

D: Enter the panel height for the guards on the left and right end of the machine.

Note: The light curtain mounting extrusion will be a minimum of 8” longer than the light curtain field of coverage.

E: Enter inside frame dimension at the rear of machine.

F: Enter height from floor to top of bed. Also provide maximum and minimum feedline height.

G: Enter dimension from back of the slide to rear of machine.

If floor/roof sections are required, please read the instructions (E & F) on the previous page and provide dimensions in the Notes section above.

Notes:

* ½” square black mesh will be furnished in the nonadjustable portion of the assembly unless otherwise specified in Notes section above.

Precautions should be taken when applying light curtains for point-of-operation safeguarding. Be sure that someone cannot pass through or stand undetected between the plane of light and the hazard when a light curtain is mounted in a vertical position. If a light curtain must be mounted in this manner due to the safety distance requirements or because of the configuration of the machine, be sure that supplemental safeguarding is provided to safeguard this pass-through area. Examples of supplemental safeguarding include a horizontally mounted light curtain, single-beam devices, guards, or pressure-sensitive safety mats on the floor.
STATIONARY MOUNTING BRACKET SPECIFICATIONS FOR MODELS:
SB-2, SB-3 OBI, SB-3 SS, SB-3 SSG, SB-5, AND SB-5 G

If more than one machine is to be measured, please make copies of this page.

Company________________________________________ Address________________________
City_________________________ State_________________________ ZIP____________________
Attention ___________________________________ Rep. ____________________________
Machine Mfr. and Model No. __________________________ Machine No. __________________
Measured By ________________________________

Check the required stationary bracket. If the standard dimensions specified here do not fit your application, indicate the dimensions required. The A dimension for all brackets should be a minimum of 8” more than the light curtain field-of-coverage height.

**CHOICES OF GUARDING MATERIAL:** 1/4” square or 1” square black (Blk) or yellow (Y) mesh, or polycarbonate (PC). 1/2” square black mesh is furnished as standard guarding material unless otherwise specified.
STATIONARY MOUNTING BRACKETS

These stationary light curtain mounting brackets are economical, heavy-duty, and versatile. Their design allows them to be tailored to each individual machine. They are available in two-, three-, or five-section assemblies. They are ideal for applications where side barriers (guards) will be fabricated by the user or provided separately. Two of the stationary light curtain mounting brackets can also be furnished with integral guarding material. See the measurement form on the previous page.

The two-section and three-section (SS) brackets can be used whenever mounting brackets can be installed on the front surface of the machine. The three-section (OBI) should be used when the brackets must be mounted to the sides of the machine (see photo). The five-section can also be mounted on the sides of the machine, at both the top and the bottom for greater stability. All of these brackets are designed for use on gap-frame presses or press brakes.

These brackets are constructed of 2" square extruded aluminum which attach to the machine with L-shaped mounting feet. The brackets are fastened to the mounting feet with T-nuts and cap screws. Each mounting foot has two holes which are used for mounting the bracket to the machine. Fasteners are included with each assembly.

When light bars (transmitter or receiver) cannot be conveniently mounted to the machine, a floor stand can be furnished. Floor stands can also be used when safeguarding large work envelopes or perimeter areas. Mirrors or single-beam devices can be attached to the floor stand when the application requires multiple-sided safeguarding. Light bars, single-beam devices, or mirrors can easily be adjusted up or down on any side of the upright extruded-aluminum stand.

This floor stand assembly consists of a 6' length of 2" square extruded aluminum, one base, and two right-angle brackets with fasteners. The base has four holes for permanent attachment to the floor with bolts (not furnished). Other floor stand sizes are available. Please consult the factory.
MIRRORS FOR LIGHT CURTAINS

Mirrors can be used with the light curtain to protect more than one side of the point of operation or work envelope. The mirrors can help protect two, three, and even four sides of the point of operation or perimeter area (see next page). They are usually mounted on a 45° angle at each corner of the area to be safeguarded. Mounting hardware is provided which can be used with the floor stand illustrated on the previous page, or with the SAB-LC/M bracket illustrated on page 39. Shock and vibration isolation mounting fasteners are also provided with each mirror.

The mirror frame is constructed of 1 1/2” square aluminum extrusion with a rubber gasket. This gasket protects the mirror from machine vibration and shock load.

Special-size mirrors are available upon request.

ADJUSTABLE MIRROR MOUNTING BRACKET
—PART NO. MMB-F

Adjustable mirror mounting brackets are available for mounting mirrors to floor stands. These brackets are designed to provide easier alignment between light curtains and mirrors. Each adjustable mirror mounting bracket consists of two pieces of 1” x 2” extruded aluminum (48” long) connected by a rotating corner bracket. Please contact Rockford Systems if the standard dimension does not meet your requirements.
LIGHT CURTAIN AND MIRROR SWING-AWAY MOUNTING BRACKETS (PART NO. SAB-LC/M)

These brackets can be used on a variety of machines which require two-sided or three-sided light curtain protection. One light curtain and one mirror provide two-sided protection; one light curtain and two mirrors provide three-sided protection (see illustration).

The left and right sides of these brackets have the ability to adjust in both directions. This provides flexibility for different production runs so the light curtain can always be mounted at the proper safety distance.

The assembly for three-sided protection consists of the brackets on the left and right side plus the rear barrier guards. One light curtain and two mirrors (see previous page for mirror part numbers) must be ordered separately.

The assembly for two-sided protection consists of one left-side bracket or one right-side bracket. Please specify at time of order. One light curtain and one mirror must be ordered separately. One floor stand or one light curtain mounting bracket is also required to mount the other light bar. See pages 32-38 for brackets, floor stands, and mirrors.

This drawing is for illustrative purposes only.
TWO-HAND CONTROL

Two-hand control can be used as a safeguarding device in the single-stroke mode of operation on part-revolution clutch presses and hydraulic press and press brakes.

There are many requirements that must be met before two-hand control can be used as a point-of-operation safeguard. These requirements are located in OSHA 29 CFR 1910.217 and ANSI B11.1, B11.2, B11.3, and B11.19. We have referenced the following paragraphs for your convenience:

**OSHA**

(c)(3)(i) Point-of-operation devices shall protect the operator by:

(e) Requiring application of both of the operator’s hands to machine operating controls and locating such controls at such a safety distance from the point of operation that the slide completes the downward travel or stops before the operator can reach into the point of operation with his hands;

(c)(3)(vii) The two-hand control device shall protect the operator as specified in paragraph (c)(3)(i)(e) of this section.

(a) When used in press operations requiring more than one operator, separate two-hand controls shall be provided for each operator, and shall be designed to require concurrent application of all operator controls to activate the slide. The removal of a hand from any control button shall cause the slide to stop.

(b) Each two-hand control shall meet the construction requirements of paragraph (b)(7)(v) of this section.

(c) The safety distance (Ds) between each two-hand control device and the point of operation shall be greater than the distance determined by the following formula:

\[ Ds = 63 \text{ inches/second} \times Ts \]

Ds = minimum safety distance (inches);

63 inches/second = hand speed constant; and

Ts = stopping time of the press measured at approximately 90° position of crankshaft rotation (seconds).

(d) Two-hand controls shall be fixed in position so that only a supervisor or safety engineer is capable of relocating the controls.

(b)(7)(v) Two-hand controls for single stroke shall conform to the following requirements:

(a) Each hand control shall be protected against unintended operation and arranged by design, construction, and/or separation so that the concurrent use of both hands is required to trip the press.

(b) The control system shall be designed to permit an adjustment which will require concurrent pressure from both hands during the die closing portion of the stroke.

(c) The control system shall incorporate an antirepeat feature.

(d) The control system shall be designed to require release of all operator hand controls before an interrupted stroke can be resumed.

**ANSI**

The following formula is used to compute the minimum safety distance (Ds) on mechanical power presses to meet the ANSI (American National Standards Institute) B11.1 press safety standard:

\[ Ds = K \times (Ts + Tc + Tr + Tspm) \]

where:

K = Hand speed constant (63 inches/second)

Ts = Stop time of equipment measured at the final control element

Tc = Response time of the control system

Tr = Response time of the two-hand control device and its interface

Tspm = Additional time allowed for the stopping performance monitor to compensate for variations in normal stopping time

Dpf = The added distance due to the depth penetration factor. Note: If the channel blanking feature is used on light curtains, additional safety distance must be enforced based on the number of channels blanked.

When determining the safety distance, a portable or built-in stop-time measuring unit must be used to check the stopping time (Ts) of the machine. Please see pages 5-6 for details on a portable STM (stop-time measurement) device.

The application of any safeguarding device, the requirements of proper machine interface, as well as the safety distance formulas may be difficult to understand and apply. When any of these safeguarding devices detailed in this section are a consideration, these factors must be evaluated. To help understand how to apply these devices, we offer monthly safeguarding seminars to educate the employer/user on the safety requirements.
ALL-IN-ONE TWO-HAND CONTROL

The all-in-one two-hand control is a NEMA 12 control box with a control module, two relays, a terminal strip, and two buttons. Everything in the control box is prewired and ready for the user to bring wires in from the machine actuator.

FEATURES

- Buttons must be maintained (actuated) during hazardous portion of the cycle
- Nonresumption of an interrupted cycle
- Provides control reliability of the two-hand control portion of the control system
- Compact design for ease in mounting and can be easily applied to small machines or devices
- Choice of control actuating buttons
- Available in 24 V DC or 115V DC

The all-in-one two-hand control can be applied to most any machine or device that is pneumatically, hydraulically, or electrically operated that is usually manually fed. These machines or devices include small presses, stakers, riveters, and assembly machines. The all-in-one two-hand control can be used as a point-of-operation safeguarding device as long as it is located at the proper safety distance. For more information on two-hand control or two-hand trip, see pages 35 and 36-37. See the chart on the next page for selecting the proper two-hand control part number.

For information on mechanical and hydraulic power press and press brake controls, please call us toll-free at 1-800-922-7533, or visit our Web site at www.rockfordsystems.com.
SELECTING AN ALL-IN-ONE TWO-HAND CONTROL

To determine the 6-digit configured part number for the two-hand control required, follow directions 1-4 below and use the information in the PART NUMBERING SYSTEM CHART below.

1. The first 3 digits for all two-hand controls are THC
2. The 4th digit determines the type of run button, if provided, on the control enclosure. Zero (0) indicates no run buttons provided.
3. The 5th digit determines the type of emergency-stop button, if provided. Zero (0) indicates no emergency button provided.
4. The 6th digit is for the operating voltage existing at the machine.

TWO-HAND TRIP

Note: There are two (2) possible applications for two-hand trip on full-revolution-clutch presses: to initiate a press cycle only, or as a method of safeguarding the point of operation for operators. In both instances, OSHA has established certain requirements. Applicable ANSI standards can also be referenced for two-hand trip.

(1) TWO-HAND TRIP
—USED AS A METHOD OF INITIATING A PRESS CYCLE ONLY

F(b)(6)
(i) A two-hand trip shall have the individual operator’s hand controls protected against unintentional operation and have the individual operator’s hand controls arranged by design and construction and/or separation to require the use of both hands to trip the press and use a control arrangement requiring concurrent operation of the individual operator’s hand controls.

(ii) Two-hand trip systems on full-revolution-clutch machines shall incorporate an antirepeat feature.

(iii) If two-hand trip systems are used on multiple-operator presses, each operator shall have a separate set of controls.

This description covers the use of two-hand trip as an initiating means only, to obtain a press cycle. It does not provide any type of point-of-operation safeguarding. Some other properly applied and installed guard or device must also be provided in accordance with OSHA 29 CFR 1910.217(c).

(2) TWO-HAND TRIP—USED AS A METHOD OF SAFEGUARDING THE POINT OF OPERATION.

TWO-HAND TRIP
(c)(3)(i) Point-of-operation devices shall protect the operator by:

(e) Requiring application of both of the operator’s hands to machine operating controls and locating such controls at such a safety distance from the point of operation that the slide completes the downward travel or stops before the operator can reach into the point of operation with his hands;

(c)(3)(viii) The two-hand trip device shall protect the operator as specified in paragraph (c)(3)(i)(e) of this section.

(a) When used in press operations requiring more than one operator, separate two-hand trips shall be provided for each operator, and shall be designed to require concurrent application of all operator controls to activate the slide.

(b) Each two-hand trip shall meet the construction requirements of paragraph (b)(6) of this section.

(c) The safety distance (Dm) between the two-hand trip and the point of operation shall be greater than the distance determined by the following formula:

\[ D_m = 63 \text{ inches/second} \times T_m \]

where:

- \( D_m \) = minimum safety distance (inches);
- 63 inches/second = hand speed constant; and
- \( T_m \) = the maximum time the press takes for the die closure after it has been tripped (seconds). For full-revolution-clutch presses with only one engaging point, \( T_m \) is equal to the time necessary for one-and-one-half revolutions of the crankshaft. For full-revolution-clutch presses with more than one engaging point, \( T_m \) shall be calculated as follows:

\[ T_m = \frac{1}{2} + \frac{1}{\text{Number of engaging points per revolution}} \times \text{time necessary to complete one revolution of the crankshaft (seconds)} \]

Note: See chart (next page) for easy reference when applying two-hand trip on full-revolution presses.

(d) Two-hand trips shall be fixed in position so that only a supervisor or safety engineer is capable of relocating the controls.

When applying two-hand trip to meet the requirements for a point-of-operation safeguarding device, make sure the buttons are located on the press so they are at least the minimum safety distance required by the preceding OSHA formula. Refer to the chart on the next page.

This means the palm buttons must be located far enough away so that after the press is tripped and the operator releases one or both palm buttons, the operator cannot “beat the ram” or reach into the point of operation or other pinch points before the dies close.
To establish the proper safety distance for two-hand trip on full-revolution-clutch presses, determine the speed of the press in SPM (strokes per minute) when running in the continuous mode and the number of engagement points in the clutch mechanism. Then determine the Safety Distance from the following chart.

Each square is equal to 2" of safety distance.

1, 2, 3, 4, and 14 engagements points in the clutch mechanism are the most common. Machines with other engagement points may exist.
GATE OR MOVABLE BARRIER DEVICE

Example of a Type A Gate Package

**INTRODUCTION**

Why use a gate device? According to the OSHA and ANSI standards, "operators must be prevented from inadvertently placing their hands or any other body parts in the point of operation during the die-closing portion of the press stroke." The movable gate device uses a proven method of placing a physical barrier between the operator and the point-of-operation hazard during the die-closing portion of the press stroke.

Other advantages of gate devices include the following:

1. Operators are not physically attached with wristlets to the machine as they are when using a pullback or restraint device. This means operator resistance is minimized because of the nonrestrictive design allowing more freedom of movement.

2. These devices protect other employees in the machine area.

3. A foot switch can be used to actuate the press. This minimizes stress to the hands and arms which can be caused by palm buttons.

Two types of gates are available. The first is a type A gate. It protects the operator during the entire machine cycle. This means the gate will not open until after the machine’s cycle is complete and stopped (usually in the up position). Type A gates are the only gates that should be used on full-revolution-clutch presses.

The second is a type B gate. It protects the operator during the downstroke only. The gate can open after the hazardous portion of the cycle has passed. Both type A and B gates can be used on part-revolution-clutch machines, hydraulic presses, and other cyclic machines where material is being manually fed.

**TYPE A GATE SEQUENCE OF OPERATION**

When the actuating means (palm buttons or foot switch) is operated, air pressure is released from the bottom of the gate-operating cylinder. This allows the gate to descend by gravity. Once the gate is fully down, a gate-down proximity switch senses this and the machine is allowed to make a cycle. If the gate cannot complete its downward travel, this gate-down proximity switch will not sense the gate and will prevent a machine cycle.

If the actuating means is released before the machine starts its cycle, the gate returns to the full open position with a type A gate. When the machine is actually making a cycle, air pressure is applied to the top of the gate-operating cylinder which holds the gate down and prevents it from being raised until the machine has completed its cycle. If the machine malfunctions and does not stop at the end of a normal cycle, the gate remains in the closed position.

According to ANSI (see next page), the gate must open after every cycle in order to reset the antirepeat system. If this does not happen, the machine will not make another stroke. To accomplish this, the gate control requires a signal from the machine at the open position. This signal is normally obtained from a photo-sensor or limit switch operated by a cam. Actuation of the limit switch is accomplished by the rotation of the crankshaft or any other member of the machine which makes one cycle or oscillates along one axis every stroke.

When a type A gate package is furnished for a full-revolution-clutch machine, the top-dead-center signal is provided by a limit switch assembly.

**TYPE B GATE SEQUENCE OF OPERATION**

The type B gate operates in a similar manner as the type A gate. When the actuating means (palm buttons or foot switch) is operated, air pressure is released from the bottom of the gate-operating cylinder. This allows the gate to descend by gravity. Once the gate is fully down, a gate-down proximity switch senses this and the machine is allowed to begin the cycle. If the gate cannot complete its downward travel, this gate-down proximity switch will not sense the gate and will prevent a machine cycle.
TYPE B GATE SEQUENCE OF OPERATION (CONTINUED)

If the actuating means is released before the machine starts its cycle, the gate returns to the full open position. When the machine is actually making a cycle, air pressure is applied to the top of the gate-operating cylinder which holds the gate down and prevents it from being raised until the hazardous portion of the cycle has passed.

The gate must open every cycle in order to reset the antirepeat system. The sequence for this is the same as for the A gate described on the previous page.

OSHA AND ANSI REQUIREMENTS FOR POWER PRESSES

The OSHA requirements for gate or movable barrier devices are located in 29 CFR 1910.217(c)(3)(i) as follows:

(c)(3)(i) Point-of-operation devices shall protect the operator by:

(f) Enclosing the point of operation before a press stroke can be initiated, and maintaining this closed condition until the motion of the slide has ceased; or

(g) Enclosing the point of operation before a press stroke can be initiated, so as to prevent an operator from reaching into the point of operation prior to die closure or prior to cessation of slide motion during the downward stroke.

(c)(3)(ii) A gate or movable barrier device shall protect the operator as follows:

(a) A Type A gate or movable barrier device shall protect the operator in the manner specified in paragraph (c)(3)(i)(f) (above) of this section, and

(b) A Type B gate or movable barrier device shall protect the operator in the manner specified in paragraph (c)(3)(i)(g) (above) of this section.

Note: OSHA states that the gate must enclose the point of operation. The gates illustrated are furnished as a single-panel only, allowing access to the point of operation. Other guarding material is required to safeguard the sides and back of the point of operation. Complete the proper measurement form (page 41, 43, or 44) if these need to be supplied with the gate.

The ANSI requirements for gates or movable barrier devices are located in 8.6.6 of ANSI B11.1.

8.6.6 Movable Barrier Device

1) A movable barrier device, when used, shall enclose the point of operation before a press cycle (stroke) can be initiated.

2) The device shall prevent the individual from reaching the hazards associated with the point of operation by reaching over, under, around, or through the device when in the closed position.

3) In conjunction with the press control, the device shall actuate the clutch and initiate the press cycle (stroke).

4) The barrier shall be capable of being returned to the open position should it encounter an obstruction prior to enclosing the point of operation.

5) The device shall require opening of the barrier to reset the antirepeat system of the press production system every time the press stops before a successive cycle (stroke) can be initiated.

6) The device shall be in compliance with 6.11 and 8.8.

7) The device shall provide visibility to the point of operation when necessary for safe operation of the press production system.

8) The device in and of itself shall not create a hazard to the operator or others.

8.6.6.1 Type A movable barrier device

1) A type A movable barrier device, when used, shall protect the individuals as specified in 8.6.1 (e).

2) The type A movable barrier device shall, in normal single-cycle operation, be designed to hold in the closed position until the slide has completed its cycle (stroke) and has stopped at top of cycle (stroke).

8.6.6.2 Type B movable barrier device

1) A type B movable barrier device shall protect the individuals as specified in 8.6.1 (f).

2) The device shall not be used on full-revolution-clutch presses.

3) The device shall, in normal, single-stroke operation, be designed to hold in a closed position during the closing portion of the cycle (stroke), or until cessation of slide motion during the closing portion of the cycle (stroke).

4) When the protection of the operator is dependent upon the stopping action of the press, a stopping-performance monitor shall be required in conformance with 6.12.
GATE ASSEMBLIES

The gate assembly can be furnished with side guards. The gate and side panel can be swung open to the left when changing dies. A dead-bolt latch is located on the right extrusion. When side guards are furnished, this latch releases the gate so it can be swung completely open.

These gates are easily mounted on the bolster of the machine or on a special plate or bracket on the front of the machine.

The gate assemblies listed are designed for a variety of machines, including full-revolution-clutch presses. Side guards are also required when using a gate. Gates are made according to the measurements submitted. Please complete the appropriate measurement form on page 41, 43 or 44 for a complete assembly.

GATE ASSEMBLY COMPONENTS

- Gate frame assembly
- Gate panel
- Proximity switch (24 V DC only) or limit switch
- Air cylinder(s)
- Quick dump valves
- Air flow control valves
- Solenoid air valve assemblies
- 1/8" air regulator gauge and mounting bracket
- Extrusion, hinge assembly, and mounting hardware

GATE CONSTRUCTION

The panel framework of these gates is constructed of 1" x 2" extruded aluminum which slides up and down on roller bearings in a rail extrusion. The panel of the gate is furnished with either clear polycarbonate (3/16"-thick) or an adjustable lower section.

The standard gate assembly is furnished with hinges allowing it to swing open. A button-head cap screw on a locking plate holds the gate in place. This feature is useful when changing dies or working on dies in the machine.

*Other lift heights are available. Please complete the measurement form on page 41, 43 or 44.

For full-revolution-clutch presses, part-revolution-clutch presses, or hydraulic presses with a gate interface, please consult the factory.

PRICING/ORDERING INFORMATION

The following information is required to order or price a gate assembly:

1. Choose a gate lift height of either 12"* or 18"*
2. Provide gate’s outside dimensions in height and width
   OR
3. Provide gate’s inside opening dimensions in height and width
GATE ASSEMBLY & BARRIER GUARD MEASUREMENT FOR STRAIGHT-SIDE, HYDRAULIC, OR COLUMN-TYPE MACHINES

If more than one machine is to be measured, please make copies of this page.

☐ Company __________________________  Address __________________________

City __________________________ State __________________________ ZIP __________________________

Attention __________________________  Rep. __________________________

Mach. Mfr. & Model No. __________________________  Mach. No. __________________________ Measured By __________________________

Check Type of Machine:  ☐ Straight Side (SSG)  ☐ Hydraulic (HG)  ☐ Column (CG)

MEASURING INSTRUCTIONS

The gate assembly measurement form is designed to be used for the XL1SSG, XL1HG, or the XL1CG.

1. Fill in the complete heading as indicated.

2. Check whether an Outside or Inside mount is required. (See lower left side of front view drawing for examples.)

3. Enter center mounting dimension. The gate opening will be approximately 7” smaller than this dimension.

4. Enter gate height, frame type, and construction of nonadjustable area.

5. Enter gate lift height: 12”, 18”, or other.

6. Enter upper and lower gate mount limits, if any.

7. If outside mounted, enter the appropriate location of upper and lower mounting point for each mount.

8. Enter the desired length and type of mount supports; either FMG for direct or EMG for extended. Allow for any obstructions (7” minimum).

9. Enter dimensions for side guards if required.

10. Indicate if floor section is required for the gate frame. Provide height and length.

11. Indicate if hinged gate is required. If yes, indicate the type of interlock switch required.

12. Choose a proximity switch (for 24 V DC only) or a limit switch.
MEASURING INSTRUCTIONS FOR GATE ASSEMBLY MODELS XL2G THROUGH XL6G

The following instructions are for measuring XL2G through XL6G gate assemblies and barrier guards. The basic information necessary to quote or fabricate any of the listed gates and barrier guards is the size of the gate, the frame type, nonadjustable area construction, height of panel(s), panel segments (if required), and mounts to attach the gate and guards to the machine. The length of all panels will be determined by Rockford Systems.

The following instructions are purposely kept as simple as possible to avoid long explanations of the many variations available.

1. Fill in the complete heading as indicated.
2. Check appropriate gate model number.
   - XL2G = 2 panel and gate
   - XL3G = 3 panel and gate
   - XL4G = 4 panel and gate
   - XL5G = 5 panel and gate
   - XL6G = 6 panel and gate
   (If any panels are not required, cross them out in the panel chart.)
3. Measure and record the bolster width and depth.
4. Measure web width of frame, if the barrier guard is to be mounted to the front of the frame behind the bolster plate.
5. Measure and record the distance from the mounting point of the guard on the frame of the machine to the rear of the bolster. Measure and record the outside width of the press frame behind the bolster plate.
6. Indicate desired position of L and R panels and gate relative to the bolster. Drawing shows panels and gate outbound of the bolster. If panels or gate should be inbound, enter minus (-) dimensions, or on the bolster, enter zero.
7. Enter the minimum and maximum feedline heights. Enter distance from the bottom of the gate to bolster (usually 0 inches). If below bolster, enter inches.
8. Measure and record the clearance from the flywheel cover or obstruction to the top of the bolster. This dimension could affect the panel height if the panel is to be swung underneath. Indicate if view is from left or right side of the machine.

   When measuring, be sure the gate will lift completely without hitting any obstruction.
9. Measure and record the feedline depth.
10. Indicate the gate lift height required, normally 12” or 18” is sufficient.
11. Indicate mounts required for LR, L, R, or RR panels.
   - SFM Side Frame Mount
   - SFM7 Side Frame Mount (3”, 5”, or 7”)
   - SFM24 Side Frame Mount up to 24”
   - FFM Front Frame Mount

   Note: The panel will begin approximately 2½” from the mounting point with the SFM, SFM7, or SFM24 mount. The panel will begin approximately 1” from the mounting point with the FFM mount.

12. Indicate frame type for each panel and gate.
   - NAP Nonadjustable Panel
   - AP1 Adjustable Panel (1/2 frame)
   - AP2 Adjustable Panel (5/8 frame)
   - AP3 Adjustable Panel (3/4 frame)
   - AP4 Adjustable Panel (Center—Full frame)
   - AP5 Adjustable Panel (Lower—Full frame)
   - API Adjustable Panel (Incliable)

   The gate can ONLY be NAP or AP3.
13. Indicate the construction of the nonadjustable area for each panel.
   - B 1/2” Sq. Black Mesh (16 gauge)
   - B1 1” Sq. Black Mesh (12 gauge)
   - Y 1/2” Sq. Yellow Mesh (16 gauge)
   - Y1 1” Sq. Yellow Mesh (12 gauge)
   - PC Polycarbonate (3/16” thick)

   The gate is normally polycarbonate.
14. Indicate height of each panel.
15. Indicate length of each panel. Rockford Systems will determine length(s) based on other dimensions provided.
16. Indicate panel segment type, height, length, and if hinged or nonhinged, if required.
   - FS Feeder Segment
   - AS Adjustable Segment
   - PCS Polycarbonate Segment
   - ES Empty Segment
17. Indicate if L, LF, Gate, RF, or R panels require an interlock switch and choose locking or nonlocking.
18. Indicate if L, LF, Gate, RF, or R panel needs to be hinged (L or R).
   The gate ALWAYS hinges left.
19. Indicate if hairpins are required in place of LR or RR panel. The number of hairpins supplied will be determined by the height of the L or R panel. Indicate the height of hairpins required in the box.
20. Indicate if roof section(s) are required. Provide height and length.
21. Indicate if floor section(s) are required. Provide height and length.
22. Choose proximity switch (for 24 V DC only) or limit switch.
GATE ASSEMBLY & BARRIER GUARD MEASUREMENT FORM—GAP OR C-FRAME MACHINES

Mach. Mfr. & Model No. __________________________ Mach. No. __________________________ Measured By __________________________

INSTRUCTIONS

1. Provide complete information.
2. Determine gate height required.
3. Determine gate opening required.
4. Determine gate lift height required.
5. Choose gate panel construction required.
6. Choose proximity switch or limit switch.
7. Choose type of interlock switch.

GATE ASSEMBLY COMPONENTS
- Gate frame assembly
- Gate panel
- Proximity switch (24 V DC only) or limit switch
- Air cylinder(s)
- Air flow control valves
- Quick dump valves
- Solenoid air valve assemblies
- ¼" air regulator gauge and mounting bracket
- Extrusion, hinge assembly, and mounting hardware

GATE LIFT HEIGHT
- 12"
- 18"
- Other __________________________

GATE PANEL CONSTRUCTION

Check box 1 or 2 below:

1. ☐ NAP (Nonadjustable Panel)—Choose from the following:
   Nonadjustable Area
   ☐ Polycarbonate
   ☐ Wire Mesh
   ☐ ⅛" Square or ⅛" Square
   ☐ Black or Yellow

2. ☐ AP3 (Adjustable Panel)—Choose from the following:
   Nonadjustable Area
   ☐ Polycarbonate
   ☐ Wire Mesh
   ☐ ⅛" Square or ⅛" Square
   ☐ Black or Yellow

Adjustable Area—Hairpin will be 4" maximum.

5. ☐ Proximity Switch (24 V DC only) ☐ Limit Switch

6. ☐ Locking Interlock ☐ Nonlocking Interlock
PRESSURE-SENSITIVE SAFETY MATS

Safety mats are intended to be used as auxiliary or additional safeguarding equipment to protect operators and other employees in the machine area. They must not be used as the primary method of safeguarding except when all other means are not applicable.

These mats can safeguard many types of machines. Consider the following when choosing mats:

1) How is the mat to be interfaced to the existing motor control or equipment? Does a new control or starter need to be added?
2) Can the motion of the machine that is creating the point-of-operation hazard be stopped quickly? If it can, what kind of clutch and brake arrangement does it have? Is the machine hydraulically or pneumatically operated? Is it operated by any other means?

Before applying a safety mat to any machine, make sure it will be interfaced correctly with the machine control and make sure it does not interfere with productivity. The whole machine system must be considered, including safeguarding, machine control, disconnects, starters, covers for rotating parts, auxiliary parts, feeding and retrieving of workpieces, etc.

The pressure-sensitive, heavy-duty safety mats described on these pages are highly resistant to wear, oils, grease, acids and most common chemicals.

These mats function in two different ways. One way is that the machine will not start if someone or some object is on the mat. Another way is that if the machine is already operating or cycling, it will stop if someone steps onto the mat. In this case, the machine needs to be restarted once the mat has been cleared.

The mat(s) must be located so an operator or other employee, when stepping onto the mat, cannot reach into the point-of-operation hazard prior to the machine’s hazardous motion coming to a stop. See ANSI/RIA R15.06 robot safety standard for detailed guidelines on mat safety distance. Also see the ANSI B11.19 for guidelines on mat control system reliability.

MATS CAN BE APPLIED TO MANY DIFFERENT MACHINES AND AUXILIARY EQUIPMENT FOR PROTECTION.
The heavy-duty pressure-sensitive safety mats offered have been successfully used to provide auxiliary safeguarding for the hazard areas that exist in many industrial environments. Some of these include:

- Robotic welding
- Laser welding/cutting
- Water jet machines
- Pick-and-place robots
- Plastics molding machines
- Assembly machines
- Automated material handling
- Packaging machinery
- Textile machinery
- Conveyors
- Paper converting machinery
- CNC punches and tube benders

The single-piece molded construction of these safety mats means these mats will not delaminate. The mats encase conductive plates which provide stop/restart signals when pressure is applied or released. Each mat top surface has a rib pattern running parallel with the mat length which helps prevent slipping, yet is easy to clean.

All mats are supplied with a 20’ single-jacketed, four-wire cord exiting from the width end of the mat. The outside edge of each mat has a lip to attach either an aluminum ramp or a blunt edge. The lip can also be removed when joining two mats with a mat connector. The mat dimensions provided are for the active area of the mat.

These mats can be supplied individually or in multiple configurations. They are available in various sizes and can be tied together (electrically) in series.

The part numbers listed in the chart on the next page do not include any ramps, blunt edges, or connectors. Follow the instructions below the chart to add ramp edging.

Note: A mat control box Part No. RKR162, or Zone Monitor

MAT SPECIFICATIONS
Operating Temperature ........................................-35° to 120°F.................................(-37° to 49°C)
Individual Mat Sizes .........................12” x 12” to 48” x 72”
Activation Force .........................3 to 5 ft/lb (normal foot traffic)
Mat Cover Material ...........................................Molded vinyl
Shore A Hardness..............................72 ± 2
Mat Cable Length ...........................................20 ft
Load Capacity ..............................................3,000 psi
Applicable Standards...Designed to meet or exceed ANSI B11.19,.................................OSHA 1910.212, and ANSI/RIA R15.06

ELECTRODE ASSEMBLY:
- Normally open switch
- High-durability 24-gauge steel
- 18-gauge, 4-wire, single-jacketed lead wires and optional application-specific wiring options
- Hermetically encapsulated switch and lead wires
- Designed to meet IP67 and NEMA 6
- Water-tight and totally submersible

For a complete chemical resistance chart, contact the factory.
STANDARD MATS

These heavy-duty pressure-sensitive safety mats are constructed of molded vinyl material. The molding encases two separated parallel steel plates. These plates make contact when the mat is stepped on. They have a black, ribbed pattern top surface to help prevent slipping and are easy to clean.

The mats are active over the entire surface, except the narrow border. They are designed for low-voltage (24-V DC) control circuits.

All standard size safety mats can be modified, i.e., with notches, cutouts, angles, or holes. Various configured layouts of any dimension can be supplied. Various colors, sizes, and shapes of mats are available along with different wiring options to meet your requirements. To obtain an assessment to meet your needs, submit a layout drawing complete with all dimensions and a list of your specific requirements.

Part No. PSM2436-1
Safety Mat (Includes EDG1000 Series Ramp Edging)

The pressure-sensitive safety mat information in the chart is for mats without EDG1000 Series ramp edging. To include mitered ramp edging on all four sides of the mat, add a1 to the part number and add 4" to both the width and length provided in the chart.

All mats are furnished with a 20’ four-wire cord that exits the mat at the width end.

RAMP EDGING, BLUNT EDGING, AND MAT CONNECTORS

An aluminum ramp-edged mat system can be customized to fit any shape or size area. Custom-made mats can fit most areas and even provide cutouts for machine legs, posts, or other obstructions. Send us a layout drawing with complete dimensions of the area the mats need to cover, and we will provide an assessment for the required mats and accessories.

BLUNT EDGING—EDG-2000 SERIES
Recessed installations: for flush edges against thresholds, walls, and machines.

Part No. EDG-2052-N (3/4" W x 52" L)
Part No. EDG-2096-N (3/4" W x 96" L)

MAT CONNECTORS—CON-1000 SERIES
Joins mats together: permits add-on mats for large-area installations.

Part No. CON-1052-N (52" L)
Part No. CON-1096-N (96" L)

THE MAT EDGE STYLE & MAT MEASUREMENT
The lip edge is the most common and widely used edge style for mats for single mat applications. The lip can be removed to create the square edge for use with the CON-1000 series mat connector.

*This dimension is not included in the mat widths and lengths. Do not include this in your measurements.

MAT CONTROLS

MAT CONTROL BOX—PART NO. GIC2508 & GIC2509
This mat control box provides an interface for the safety mats to the existing machine control. If someone steps on the mat while the machine is operating or cycling, the control is designed to provide a stop signal; or, if someone is on the mat(s), the stop signal will not allow the machine to start a cycle. If special applications of this control are required, please consult the factory.

This mat control is furnished in a dust- and oil-tight NEMA 12 enclosure and includes a selectable latch-out feature. When the latch-out feature is turned on, the machine will not automatically be able to restart until the latch-out has been cleared. This is accomplished with the use of the key-operated selector switch. When the latch-out feature is turned off, the machine can be restarted when the mat is cleared.

CONTROL BOX SPECIFICATIONS
Voltage ........................................................................................................... 115VAC, 60 Hz
Output-Relay Contacts Rating....................................................................... 10 A, 115VAC Resistive
MAT CONTROLS (CONTINUED)

If the mat control box Part No. RKR162 is not required, a DIN-rail mounted control module is available. Each control module has 4 NO safety contacts and 1 NC auxiliary contact. The control module allows operation in either automatic or manual reset modes.

MAT JUNCTION BOXES

If multiple mats are grouped together to provide auxiliary or perimeter (work-envelope) safeguarding, junction boxes may be required to facilitate the installation.

Use either mat junction box with either the mat control box RKR162 (previous page) or a DIN-rail mount control module from above. Each mat junction box includes 20’ of four-wire cord.

</tbody>
</table>

Part No. RFT139
This DIN-rail mount control module can be mounted into an existing enclosure.

Part No. RKR021
This mat junction box can provide wiring for up to 10 mats for easy tie-in to the mat control.
(Cover has been removed for photo.)
DETECT-A-FINGER® GEN II DROP-PROBE DEVICES FOR RIVETERS

INTRODUCTION
For organizations that use riveters and welders, the new and improved Detect-A-Finger Gen II drop-probe device helps to protect operator’s fingers from pinch-point hazards and meets the compliance requirements for a Category 2 safeguarding device. The Gen II upgrades include a longer stroke up to 1.85”, unified right- and left-handed operation, a pre-punched enclosure to achieve faster electrical connections, and a softer probe rod for accurate template development, designed to provide a safer and more cost effective solution that reduces the potential for operator bypassing. The Detect-A-Finger drop-probe devices are used on small machines, such as riveters, eyeletters, stakers, staplers, crimpers and fastening machines, to help protect the operator’s fingers from point-of-operation hazards. To make retrofitting older models quick and easy, the Gen II features the identical mounting pattern as the original model, creating a “drop-in” solution that is simple to deploy.

RKC008 AND RKC009 SERIES
HOW IT WORKS
The aluminum “template” probe is shaped by the user to fit each application. This template is then used as an aid to facilitate the forming of the “permanent” steel hexagonal drop probe, which can be adjusted from 0” to 1.85” and are keyed to the device, thereby preventing operator bypassing. These devices are designed to drop by gravity. If a finger or workpiece is in the way of the probe and the probe is not allowed to complete its downward travel, the machine will not start a cycle or stroke. On these models, the rotary solenoid is in the control box and when energized, after initiation of the cycle, allows the probe to drop. A spring returns the probe to its starting or up position. Another drop-probe device uses interlocking cams in its operating mechanism. The control box consists of the probe arm, rotary electric solenoid, two-hand control safety relay, redundant limit switches, basic circuit with terminals and other mechanical mechanisms. On machines that are mechanically operated, an air cylinder or electric solenoid may have to be added to the operating linkage to trip the machine. On machines that are hydraulically or pneumatically operated, the drop-probe control can usually be interfaced with the existing control system.

When updating machines to meet safety standards, please make sure that each machine is looked at as an individual system that includes, but is not limited to, safeguarding (drop-probe device), machine control, disconnect switch, motor starter, covers for rotating components, auxiliary parts, lockout/tagout equipment, and feeding and retrieving of workpieces. Two 20” drop-probe rods are furnished with each control box: one aluminum template and one hexagonal steel permanent rod. These rods are shaped by the user for the workpiece or assembly requirements.

SEQUENCE OF OPERATION
The operator initiates the cycle of the machine usually by an overt action on the foot switch. This energizes the rotary solenoid in the control box, which allows the drop probe to drop until it makes contact with a limit switch. If an obstruction, such as a finger, gets in the way of the probe, the limit switch is not contacted and the machine does not start its cycle. If nothing obstructs the probe and the limit switch is operated, a relay will signal the machine to start its cycle. Next, the relay drops out, de-energizing the control box solenoid, allowing the probe to move up and out of the way. At this time, the machine completes its cycle and stops. The foot switch must be released and re-initiated to begin another cycle.

The Detect-A-Finger Gen II is available in two models: Part No. RKC009 is for mounting on the right side of a machine (probe on left), and Part No. RKC008 is for mounting on the left side of a machine (probe on right). Rockford Systems also offers a new drop-probe kit (FCT057), that includes a clamp, one soft aluminum rod to aid in creating a template, and one tougher steel hex probe. If needed, add the FOOT SWITCH (CTD088). Complete installation instructions and a maintenance manual are furnished with each device.

Select the Detect-A-Finger Gen II For Riveters that allows the sensing probe to enter the point of operation, without obstructing the work area, and provides for as short and rigid of a sensing probe design as possible.

ALTERNATIVE PINCH-POINT SAFETY SYSTEM
Our new, premium solution – the UNITROL SOFT TOUCH Pinch-Point Safety System – is the first and only fully passive safeguarding equipment designed to prevent a pneumatic riveter, welder or other small machine from applying full force if it detects fingers in the machine’s point-of-operation area by measuring electrical continuity between electrodes. If anything other than metal is present between the electrodes, their sensors will not detect continuity and the electrodes will open automatically.

Please call 1-800-922-7533 to learn more about Rockford Systems’ range of riveting and welding safety solutions.

RKC500 SERIES

FOR SAFEGUARDING RESISTANCE-TYPE SPOT WELDERS

The RKC500 series Detect-A-Finger® drop-probe device reduces accidents at the point of operation where an operator’s fingers can enter. The key components of this device are a sensing probe module with the rod shaped to fit over or around the workpiece, and a control module. When the operator initiates a machine cycle, the sensing probe is released and drops by gravity over or around the workpiece. If the operator’s fingers are still in the hazard area, the sensing probe will not reach its preset position and will not allow the spot welder to start its cycle. If there are no obstructions to prevent the sensing probe from dropping, when it reaches its preset position, the control unit will allow the machine to cycle.

The compact design of the sensing probe module allows it to be attached to the welder arm. The drop-probe stroke is 15/8”.

TYPICAL APPLICATION: PRESS-TYPE RESISTANCE WELDER

This Detect-A-Finger® drop-probe assembly may be mounted either to the moving member of a welder (upper arm), like the rocker-arm type illustrated above, or may be mounted to a fixed part of a welder, like the press-type illustrated above. Depending on the type of welder, a single-stage or a two-stage foot switch may be required.

The Detect-A-Finger® may also be applied to mechanical foot pedal-type welders. To convert from a mechanical operation, the mechanical pedal must be removed and replaced with an air cylinder to operate the arm and foot switch. The cylinder bore and stroke (push- or pull-type) can be determined from actual machine measurements, and the method and location of attachment to the welder linkage. The air cylinder can be controlled by a three-way normally closed 115 VAC solenoid air valve. Adjustable flow control valves may be employed to smooth the welder arm movement, and an air filter-regulator-lubricator assembly may also be required.

See previous page for these components.
RKC500 SERIES (CONTINUED)

COMPONENTS

The RKC500 Detect-A-Finger® device for spot welders consists of two components: the control box (mounted on the frame of the welder) and the drop-probe assembly (mounted on the upper arm).

The control box provides interface of the Detect-A-Finger® device to the spot welder’s control system.

In addition to the control box, each unit is furnished with two plain 18” aluminum drop-probe rods. These rods are to be shaped by the user to specific requirements. To prevent welding splash, additional lightweight clear plastic shielding can be attached to the rod. Complete installation instructions and a maintenance manual are provided with each assembly. Insulated mounting hardware for the probe unit is also included.

A single-stage foot switch with a fully guarded top and sides is also available, if required. Foot switch Part No. CTD011 has a die-cast cover that protects the top and sides, and the front is protected by a hinged flap. These features protect from unintentional operation. (If a two-stage foot switch is required, please consult the factory).

DANGER SIGNS FURNISHED WITH ALL DETECT-A-FINGER UNITS

Operator safety precautions and a danger sign are furnished (in English unless otherwise requested) with each drop-probe device.

Part No. KSC000 (English)
Part No. KSC000S (Spanish)

Part No. KSC055 (English)
Part No. KSC055S (Spanish)
The DAF100 Detect-A-Finger- drop-probe device is an electric-air system that consists of two main components: the drop-probe assembly and the control box. The standard unit can provide a stroke of up to 4” and can be mounted on the left or right side of the machine. Location of the DAF100 should be determined by the availability of the mounting surface, the size or shape of the workpiece, and the throat depth of the machine.

The drop-probe assembly functions by allowing the sensing probe to drop around the point-of-operation hazard prior to each intended machine cycle. If the sensing probe encounters the operator’s fingers and fails to drop to a preset position, the machine cycle will not be initiated. If there are no obstructions to prevent the sensing probe from dropping, then the control unit will allow the machine to cycle when the sensing probe reaches the preset position.
DAF100 SERIES (CONTINUED)

COMPONENTS
The DAF100 system consists of two main components: the drop-probe assembly and the control box. The drop-probe assembly consists of an air cylinder and solenoid operated air valve with an adjustable down stop locking collar, limit switch, magnetic proximity switch, and a PVC insulator block. The control box consists of a control circuit board, safety relays, and pin-type plug-in terminals.

Each DAF100 system is furnished with one mini air filter, two mini air regulators, 25’ of 5/32” PVC tubing, 4’ of 1” x 2” extruded aluminum for mounting, and two plain 18” aluminum sensing probes. These sensing probes are shaped by the user to the workpiece or assembly requirements. Complete installation instructions and a maintenance manual are provided with each assembly.

ADDITIONAL COMPONENTS
Additional components may be required to trip or cycle the machine that is being safeguarded with the DAF100 drop-probe device. See page 52 for these additional components.
UNITROL SOFT TOUCH

THE DANGER OF PINCH-POINT HAZARDS

Riveting and resistance (spot) welding are essential processes in the successful manufacturing of products in fast-paced industries including aerospace, marine, garments, railcar and automotive. Unfortunately, pinch point accidents involving these machines are all-too-common. These types of accidents occur when rivet heads or welding electrodes are driven together at forces up to 12,000 PSI while an operator’s hands are pinched between them, leading to mangled, crushed or severed fingers.

According to OSHA, hand injuries account for nearly one-third of the thousands of disabling on-the-job accidents occurring each year. Most of these hand injuries are the result by pinch point accidents — 80 percent of them in fact. Since pinch points are the root of such a large number of hand injuries, it’s best to install viable pinch-point safety on the two machines where these injuries commonly occur: resistance welders and riveters.

THE SOFT TOUCH PROMISE: REDUCE INJURIES WITHOUT SACRIFICING PRODUCTIVITY

The SOFT TOUCH Pinch-Point Safety System is the first and only fully passive safeguarding system designed to prevent a riveter, spot welder or other small machine from applying full force if it detects fingers in the machine’s point-of-operation area. SOFT TOUCH prevents hand injuries and eliminates associated expenses such as hospitalization, lost days of work, higher insurance premiums and legal action. It does all this while not slowing down manufacturing operations. OSHA-compliant SOFT TOUCH technology will take you from pinch point to pinch-proof without losing a minute of productivity.

UNRIVALED PINCH-POINT SAFETY THROUGH SENSOR TECHNOLOGY

UNITROL’s outstanding quality and reliability, combined with the SOFT TOUCH’s advanced sensors and tamper-proof operation, come together to create a best-in-class pinch-point safety system.

Unique to the industry, the SOFT TOUCH measures electrical continuity between electrodes to verify they are actually touching the part to be welded — and not the operator’s fingers. If anything other than metal is present between the electrodes, their sensors will not detect continuity and the electrodes will open automatically. This simple step prevents the machine from delivering high-pressure riveting or welding force onto the operator’s fingers. In addition, a display instantly warns the operator of the danger. SOFT TOUCH has proven far more effective than traditional safeguarding methods such as ring guards or light curtains. In fact, thousands of SOFT TOUCH systems have been installed around the world with a 100 percent safety record.

Because time is money, SOFT TOUCH does not waste either. When continuity is detected between the electrodes — meaning only metal is present — full riveting or welding force is applied and operations proceed normally without delay. No time-consuming operator adjustments, such as replumbing the air system to change the pneumatics, are required. Also, SOFT TOUCH will automatically compensate for any changes in transformer tap switch position or line voltage shifts, preventing production from being abruptly stopped.

As with all safeguarding equipment, proper installation is critical. The experienced safeguarding professionals at Rockford Systems can install your SOFT TOUCH system and train your operators on its safe use.
**HOW SOFT TOUCH WORKS**

1. The welding electrodes close under **low force**. The unique pneumatic systems designed by UNITROL for the process can counter-balance the weights of the ram on large press welders. Even where the dead-weight of the welder ram is hundreds of pounds, the electrode force produced will be 50 pounds or less.

2. The welding control checks to see if metal has been detected between the electrodes within a customer set maximum time limit.

3. If metal is **not** detected, the electrodes open automatically and do not go to welding force. A display tells the operator the problem.

4. If metal is **detected**, full welding force is applied and the weld proceeds normally.

**KEY BENEFITS:**

1. **Fail Safe Operation:**
   - If any of the system sensor wires become shortened or disconnected, the SOFT TOUCH system will lock out and not let the electrodes close, or the riveting or welding sequence to continue
   - If the SOFT TOUCH sensor board detects electrode continuity before the foot switch or hand switches are closed, the system will lock out and not allow any electrode movement

2. **No Operator Adjustments:**
   - Workers cannot remove, circumvent or tamper with any part of the system
   - No operator set components
   - Does not require any adjustments when new setups are made
   - No user calibration, just install and turn power ON

3. **No Operator Bypassing:**
   - The continuity system cannot be overridden and is in place at all times that the welding machine is under power

4. **Primary System:**
   - Can be used as the primary pinch-point safety system because it is fully passive

5. **Full-Electrical Redundancy:**
   - All inputs and outputs require closure of both electro-mechanical and solid-state redundant components for fail safe operation. Self-monitors output relay to prevent any operation if a fault in the output contacts is detected
   - When welding a C-shaped part that is not fully closed and requires electrode force to push the parts together, a limit switch can be added to the riveter or welder, and be adjusted to close when the space between the electrodes is less than ¼ inch. In this case, two actions are required before the electrode force increases and the rivet or weld sequence starts

6. **Does Not Stop Production:**
   - Automatically compensates for changes in transformer tap switch position or line voltage shifts
TYPES OF MACHINES:

Works with All Types of Welders:
• SOFT TOUCH systems are available for all resistance welders, including spot welders, projection welders, seam welders and transgun welders; 1Ø AC, 1Ø DC secondary, 3Ø frequency converters, 3Ø DC rectified secondary, and MFDC (inverters)

Works with All Types of Riveters:
• SOFT TOUCH systems are available for pneumatic riveters

Other Machine Types:
• Pneumatic clinching machines, Eyeletters, Stakers, Crimpers, Fastening and Assembly Machines

Complete System:
• SOFT TOUCH replaces the existing solenoid valves and is supplied in a single NEMA-4 enclosure that is factory prewired and pre-plumbed

Options:
• All options shown below can be ordered with the SOFT TOUCH system. They can also be easily added later in the field without modification of the control.
  1. Retract Kit to be used on all resistance welders that have a RETRACT (Hi-Lift) function
  2. Timed Bypass Switch for use with poor-conductive material
  3. Limit Switch for use with poor-conductive material or for redundant sensors
  4. Pressure Regulator Kit

COMPLIANCE:
• OSHA 1910.212(a) – General Machinery
• OSHA 1910.255(b)(4) – Resistance Welding Machines
• OSHA 1910.217(c)(3)(iii) – Presence Sensing Point of Operation Device
• ANSI B11.19-2010 (8.7) (Safeguarding Methods Standard)
• ANSI B154.1-1995 (Rivet Setting Equipment)

WARRANTY:
All UNITROL products include a 5-year prorated warranty. The warranty periods are determined using the date of the new control from original ship date. Please refer to the product manual for more information on the warranty.

</tbody>
</table>
1. Make sure that the light curtain is mounted at the proper safety distance in accordance with the ANSI safety-distance equation. (See the next page for the safety-distance equation.)

2. Verify that someone cannot reach over, under, or around the sensing field of the light curtain to reach the hazard. Additional guards or safeguarding devices, if necessary, must protect these areas.

3. Turn on the machine and the light curtain. The green status-indicator light on the transmitter should be on and the red status-indicator light should be off. If the light curtain has a float-blanking feature, make sure that it is turned off. If fixed blanking is provided and used, this feature can remain on, and the blanked area should be occupied with an object that fills this entire space across the sensing field.

4. Use a test rod or other object sized according to the light curtain's minimum object sensitivity (sometimes referred to as the resolution) to confirm that all the channels in the sensing field are working properly. To do this, move the test rod through the sensing field in a pattern as illustrated to the right. The red status-indicator light on the transmitter should stay on during the entire test.

5. With the machine on and ready to be cycled in a production mode of operation, hold the test rod in the sensing field and attempt to cycle the machine. The machine should not cycle.

6. Cycle the machine and then quickly insert the test rod in the sensing field. The machine should stop immediately.

   Note: On some machines, the light curtain is muted during the nonhazardous portion of the machine cycle. If the test rod is inserted in the sensing field while the light curtain is muted, the machine will not stop. Therefore, be sure to insert the test rod during the hazardous portion of the cycle when performing this test.

7. Confirm that when the test rod is removed from the sensing field, the machine does not restart automatically.

8. Verify that in order to start another cycle (or continue a cycle that was interrupted), the normal actuating means must be reinitiated; or, if someone can pass through the sensing field and stand inside the safeguarded area, verify that the light curtain or machine control must be manually reset before reinitiation of the normal actuating means. The reset device must be located outside of the safeguarded area (so it cannot be reached from within) and within view so the operator can verify that no one is inside the safeguarded area.

9. If any of these function tests fail, take corrective action before running production. If all tests pass, remove all keys from the selector switches before running production.

**SAFETY DISTANCE FOR LIGHT CURTAIN**

The safety-distance equation from Annex D of ANSI B11.19-2010, Performance Criteria for Safeguarding, is as follows:

\[ D_s = K(T_s + T_c + T_r + T_{spm}) + D_{pf} \]

Where:

- \( D_s \) = safety distance
- \( K \) = maximum speed that an individual can approach the hazard (63 inches/second is commonly used)
- \( T_s \) = stopping time of the machine measured at the final control element
- \( T_c \) = reaction time of the control system
- \( T_r \) = reaction time of the light curtain and its interface
- \( T_{spm} \) = additional time allowed for the stopping-performance monitor to compensate for variations in normal stopping time
- \( D_{pf} \) = amount of penetration allowed by the light curtain into its sensing field before someone is detected

The value of \( D_{pf} \) can be found using one of the following figures, and it can then be used in the safety-distance equation above.
Dpf, the distance added to the safety distance due to the penetration factor, compensates for varying object sensitivities of light curtains.

When blanking features are used and when the blanked area is not completely filled by the workpiece or by mechanical guarding, the object sensitivity can be calculated as follows:

\[
\text{Object sensitivity} = \text{size of the blanked area} + \text{minimum object sensitivity without blanking}
\]

Once this value is found, then determine Dpf.

If the entire blanked area is filled with mechanical guarding or other fixed material or guards, use the light curtain’s object sensitivity to determine Dpf.

For light curtains using large blanked areas, or if an individual can otherwise reach through or over the sensing field and not be detected, the distance between any two adjacent detection points shall not be greater than 24 in (600 mm), i.e., from one active point to the next active point above.

If the individual cannot reach over the top of the sensing field and the bottom of the sensing field (A) is no more than 12 in (300 mm) above the floor.

The top of the sensing field (B) is between 36 and 48 in (900 and 1200 mm) above the floor. The bottom of the sensing field (A) is no more than 12 in (300 mm) above the floor.

Reach Through

\[ D_{pf} = 36 \text{ in (900 mm)} \]

for reach-through applications

Reach Over

\[ D_{pf} = 48 \text{ in (1200 mm)} \]

for reach-over applications

Note: Where individuals can place themselves between the safeguarding device and the hazard zone and remain undetected, additional measures must be taken.

For light curtains used in a vertical application with object sensitivity greater than 2.5 inches (64 millimeters)

For light curtains using large blanked areas, or if an individual can otherwise reach through or over the sensing field and not be detected, the distance between any two adjacent detection points shall not be greater than 24 in (600 mm), i.e., from one active point to the next active point above.

The top of the sensing field (B) is between 36 and 48 in (900 and 1200 mm) above the floor. The bottom of the sensing field (A) is no more than 12 in (300 mm) above the floor.

Reach Through

\[ D_{pf} = 36 \text{ in (900 mm)} \]

for reach-through applications

Reach Over

\[ D_{pf} = 48 \text{ in (1200 mm)} \]

for reach-over applications

Note: Where individuals can place themselves between the safeguarding device and the hazard zone and remain undetected, additional measures must be taken.

Minimum mounting height \( h \) can also be determined by the following:

\[
h = 15 (S - 2) \text{ in}
\]

\[
h = (S - 50) \text{ mm}
\]

where \( S \) is the object sensitivity.

For light curtains used in a horizontal application (30° or less) that can be reached over

<table>
<thead>
<tr>
<th>Allowable Sensing-Field Heights in Inches (Millimeters)</th>
<th>Object Sensitivity ((S))</th>
<th>Minimum Mounting Height ((h))</th>
</tr>
</thead>
<tbody>
<tr>
<td>15 (380)</td>
<td>15 (380)</td>
<td>39 (990)</td>
</tr>
<tr>
<td>22.5 (570)</td>
<td>22.5 (570)</td>
<td>39 (990)</td>
</tr>
<tr>
<td>30 (760)</td>
<td>30 (760)</td>
<td>39 (990)</td>
</tr>
<tr>
<td>33.75 (860)</td>
<td>33.75 (860)</td>
<td>39 (990)</td>
</tr>
<tr>
<td>39 (990)</td>
<td>39 (990)</td>
<td>39 (990)</td>
</tr>
</tbody>
</table>

Minimum mounting height \( h \) can also be determined by the following:

\[
h = 15 (S - 2) \text{ in}
\]

\[
h = (S - 50) \text{ mm}
\]

where \( S \) is the object sensitivity.

Note: The light curtain’s horizontal coverage must be enough to hinder an individual from stepping over its sensing field. This minimum distance is 36 in (900 mm) if supplemental safeguarding or physical barriers are used such that an individual cannot step over and clear the sensing field, and 48 in (1200 mm) if no supplemental safeguarding or physical barriers are used.
FUNCTION-TESTING CHECKLIST FOR TWO-HAND CONTROL

This is a generic function-testing checklist. Your two-hand control may have other features that require different tests. Please refer to your two-hand control installation manual.

Make sure that the two-hand control has been interfaced properly to the machine’s control system to provide control reliability.

**DANGER**

Never place your hands or any part of your body in the hazard area while performing these tests.

Always perform these tests at every setup, operator, and shift change, as well as every time after maintenance is performed.

1. Before turning the machine on, verify that:
   a. The hand controls are protected against unintended or inadvertent operation. This is usually done with ring guards or fabricated shields. (If the hand controls are nonmechanical such as capacitive or optical touch buttons, make sure that only an operator’s hands can actuate them and not other parts of his or her body.)
   b. The hand controls are separated by enough distance or configured to require the use of both hands.
   c. The hand controls are fixed in position at the proper safety distance. (See the safety-distance equation below.)
   d. Two individual hand controls are provided for each operator that is to be safeguarded by two-hand control. When there are multiple two-hand control stations, there must be an indicator at each station to indicate whether the station is on or off (usually accomplished with an indicator light), and the means of turning the station on and off must be supervisable (usually done with a key-operated selector switch).

2. With the machine on and ready to be cycled in the single-cycle mode of operation, perform the following tests.
   a. Actuate both hand controls and keep them actuated. The machine should make one complete cycle and then it should stop, even though the hand controls are still being actuated.
   b. Actuate both hand controls and release them while the machine is still in the hazardous portion of its cycle. The machine should stop. Both hand controls must be continuously actuated during the hazardous portion of the cycle.
   c. Actuate both hand controls and release only one control during the hazardous portion of the cycle. The hazardous motion of the machine should stop. Reactuate the hand control that was released. The machine should not finish the cycle. Repeat this with the other hand control. Again, the machine should not finish the cycle. Both hand controls must be released and reactuated before the machine can finish the cycle.
   d. If the two-hand control has a concurrent timer: Actuate one hand control, wait until the concurrent time limit has expired, and then actuate the other hand control. The machine should not cycle. The hand controls must be actuated concurrently within a certain time limit (usually 0.5 seconds or less) before a machine cycle can be initiated.
   e. If the machine is equipped with multiple two-hand control stations, turn off all stations and make sure that the machine does not cycle. Also perform the above tests at each two-hand control station.

3. If any of these function tests fail, take corrective action before running production. If all tests pass, remove all keys from the selector switches before running production.

The safety-distance equation for two-hand control from Annex D of ANSI B11.19-2010, Performance Criteria for Safeguarding, is as follows:

\[ D_s = K(T_s + T_c + T_r + T_{spm}) \]

Where:

- \( D_s \) = safety distance
- \( K \) = maximum speed that an individual can approach the hazard (63 inches/second is commonly used)
- \( T_s \) = stopping time of the machine measured at the final control element
- \( T_c \) = reaction time of the control system
- \( T_r \) = reaction time of the two-hand control and its interface
- \( T_{spm} \) = additional time allowed for the stopping-performance monitor to compensate for variations in normal stopping time
1. Before turning the machine on, verify that:
   a. The hand controls are protected against unintended or inadvertent operation. This is usually done with ring guards or fabricated shields. (If the hand controls are nonmechanical such as capacitive or optical touch buttons, make sure that only an operator’s hands can actuate them and not other parts of his or her body.)
   b. The hand controls are separated by enough distance or configured to require the use of both hands.
   c. The hand controls are fixed in position at the proper safety distance. (See the safety-distance equations below.)
   d. Two individual hand controls are provided for each operator that is to be safeguarded by two-hand trip. When there are multiple two-hand trip stations, there must be an indicator at each station to indicate whether the station is on or off (usually accomplished with an indicator light), and the means of turning the station on and off must be supervisable (usually done with a key-operated selector switch).

2. With the machine on and ready to be tripped in the single-cycle mode of operation, perform the following tests.
   a. Actuate both hand controls and keep them actuated. The machine should make one complete cycle and then it should stop, even though the hand controls are still being actuated.
   b. If the two-hand trip has a concurrent timer: Actuate one hand control, wait until the concurrent time limit has expired, and then actuate the other hand control. The machine should not cycle. The hand controls must be actuated concurrently within a certain time limit (usually 0.5 seconds or less) before a machine cycle can be initiated.
   c. If the machine is equipped with multiple two-hand trip stations, turn off all stations and make sure that the machine does not cycle. Also perform the above tests at each two-hand trip station.

3. If any of these function tests fail, take corrective action before running production. If all tests pass, remove all keys from the selector switches before running production.

The safety-distance equations for two-hand trip from Annex D of ANSI B11.19-2010, Performance Criteria for Safeguarding, are as follows:

For machines with full-revolution clutches that have one or more clutch-engagement points:

\[ D_s = K \cdot T_{mc} \left( \frac{1}{2} + \frac{1}{N} \right) \]

Where:

\( D_s \) = safety distance
\( K \) = maximum speed that an individual can approach the hazard (63 inches/second is commonly used)
\( T_{mc} \) = time it takes to complete a machine cycle
\( N \) = number of engagement points on the flywheel

For other machines that are tripped to initiate a cycle that cannot be stopped until the completion of the cycle:

\[ D_s = K \cdot T_{hm} \]

Where:

\( D_s \) = safety distance
\( K \) = maximum speed that an individual can approach the hazard (63 inches/second is commonly used)
\( T_{hm} \) = the time, after initiation of motion, until hazardous motion is completed
OSHA GUARD-OPENING REQUIREMENTS

Table 0-10 details the maximum permissible openings for guards as required by OSHA 29 CFR 1910.217 for mechanical power presses. A guard-opening sign is available that can be used by engineering, maintenance, etc., for reference when designing or fabricating guards. This 10" x 12" sign is made of .055"-thick semi-rigid plastic and can be mounted with nails, screws, nylon lock-strips, etc.

ANSL GUARD-OPENING REQUIREMENTS

The maximum permissible opening for guards as required by Annex D of ANSI B11.19-2010, Performance Criteria for Safeguarding, is as follows:

<table>
<thead>
<tr>
<th>Distance of Opening From Hazard [Inches]</th>

Part No. KSC012
OSHA Guard-Opening Requirements Sign
GUARD-OPENING SCALES

An OSHA or ANSI guard-opening scale can be used during the design, installation, and inspection of barrier guards to make sure they comply with the OSHA and ANSI guard-opening requirements. These engraved, acrylic copolymer guard-opening scales are available online at www.rockfordsystems.com.

**OSHA GUARD-OPENING SCALE—PART NO. KSC097**

This folding guard-opening scale is based on Table O-10 of OSHA 29 CFR 1910.217 for mechanical power presses, which shows the distances that guards shall be positioned from the point of operation based on opening size. It is constructed of acrylic copolymer and has permanent etched markings.

![OSHA Guard-Opening Scale – Part No. KSC097](image)

**ANSI GUARD-OPENING SCALE—PART NO. KSC098**

This folding guard-opening scale is based on “A Review of Machine-Guarding Recommendations” by Donald R. Vaillancourt and Stover H. Snook of the Liberty Mutual Research Center for Safety and Health. The ANSI/RIA R15.06 safety standard for industrial robots and robot systems, as well as recently revised ANSI B11—series safety standards for machine tools, use the guard-opening data from this study. The Canadian power press standard, CSA Z142-02, also uses the data from this study. One side of the scale shows English units; the other side shows metric units. It is constructed of acrylic copolymer and has permanent etched markings.

![ANSI/CSA Guard-Opening Scale – Part No. KSC098](image)

SAFETY DISTANCE GUIDE

Many OSHA and ANSI safety requirements must be met before installing two-hand control or a presence-sensing device as a point-of-operation safeguard. One requirement is that the control or device must be located at a minimum safety distance from the point of operation. This safety distance guide slide chart can be used to calculate the safety distance for these devices. The minimum safety distance is based on the stopping ability of the machine and a hand-speed constant, in addition to other factors.

![Safety Distance Guide Slide Chart Part No. LLL050](image)
MACHINE SAFEGUARDING SEMINAR INTRODUCTION

According to safety standards, when a machine creates a hazard to operators and other employees in the machine area, it must be safeguarded. We offer this machine safeguarding seminar to educate people in positions of responsibility how to properly safeguard the point of operation and other machine hazards to meet OSHA regulations and current industry standards.

This comprehensive 21/2-day seminar provides knowledgeable interpretations of the performance language of both OSHA (Occupational Safety and Health Administration) and ANSI (American National Standards Institute) standards. Twenty-four ANSI B11-series safety standards and other related standards are covered.

Classroom discussions are combined with a PowerPoint presentation and live demonstrations of machines to help attendees understand when and where safeguarding is required and how various safeguarding works. The teaching methods used and the material covered during the 21/2 days will help attendees determine compliance issues with their machinery and processes.

The metal-turning portion of this seminar primarily focuses on the ANSI requirements for chuck shields and chip/coolant shields on manually operated machines. Safeguarding by distance and location are also covered, as well as awareness barriers and devices, pressure-sensitive mats, emergency-stop devices, drop-probe devices, color-coding, warning signs, and training requirements.

Using ANSI/RIA R15.06 as a guideline, safeguarding methods for robots are discussed. This section includes the newly incorporated risk assessment/hazard analysis. An overview and interpretation of OSHA 1910.147 Lockout/Tagout and STD 1-7.3 are also included.

TRAINING CENTER

Our training center contains a number of machines including mechanical and hydraulic power presses, press brakes, an engine lathe, a vertical mill, a drill press, a pedestal grinder, a spot welder, and riveter. These machines are under power for demonstration purposes. Most of the demonstration machines are equipped with multiple types of safeguards to show how different guards and devices can be applied and used. Hands-on opportunities abound!

TRAINING INSTRUCTORS

Our instructors are well qualified, having many years of exposure to the machine-tool industry. Their experience comes from working in the field with plant engineers, safety directors, and plant managers. Instructors are also involved in the observation of the various draft stages of ANSI B11-series safety standards for machine tools.

SEMINAR MATERIALS

Each person attending the seminar receives a variety of information regarding machine safeguarding which includes the following:

- Pertinent ANSI B11 standards
- Charts and graphs for future reference
- Safeguarding product catalogs
- U.S. Department of Labor memorandums
- Mechanical power press safety information card
- Safety distance guide slide chart
- Folding OSHA and ANSI guard-opening scales
- Laminated function-testing checklists for safeguards

REGISTRATION INFORMATION

Please consult the factory or our Web site for the registration fee. This fee includes the seminar presentation and demonstrations, seminar materials including a safety distance guide, guard-opening scales, food and beverages during breaks, lunch on the first two days, and a certificate of completion. The registration fee does not include other meals, lodging, or transportation.

To enroll, call 1-800-922-7533, or register online at www.rockfordsystems.com.

SEMINAR SCHEDULE

The machine safeguarding seminar is usually held on the third Tuesday, Wednesday, and Thursday of each month. (Thursday’s session ends midmorning.) All seminar dates and times are subject to change. Please call the seminar registrar to confirm seminar dates before making travel arrangements.

CONFIRMATION

Each attendee will receive a package of detailed information prior to attending. Maps and a list of hotels are provided for students to make their own hotel reservations.

LOCATION

The seminar is held at our Rockford, Illinois, plant, which is located 65 miles northwest of Chicago O’Hare Airport.

ON-SITE AND SPECIAL GROUP SEMINARS

Machine safeguarding seminars can be presented at your company and tailored to the types of machines in your plant. We can also conduct special seminars at our facility for your group or company. Please contact our training department for details.
NOTES
EX-AL™ Barrier & Perimeter Guarding is a comprehensive catalog that features a complete line of products to safeguard machine operators at the point of operation using barrier guarding systems. Each guarding system is custom designed and built for each application.

Perimeter safeguarding systems are also featured in this catalog designed to protect individuals that work in or around large work areas. These systems can be used in numerous applications in manufacturing—around robots and robot systems, assembly machines, packaging machines, transfer lines, cut-to-length lines, slitting lines, etc.

All products in this catalog are intended and designed to meet the requirements of OSHA and ANSI safety standards.

At Rockford Systems, we are experts at machine guarding because it has been our sole focus for over 50 years. We stand committed to the prevention of injuries and fatalities. Our mission is to enhance the long-term health and quality of life of workers in high-risk occupations, while improving the bottom line of the organizations we serve by increasing compliance, reducing risk, lowering costs and improving productivity.

PORTABLE DEMONSTRATION UNIT

We offer custom guards that can be designed and built to fit most machines. Our product development and engineering personnel can design guards that are unique to your machines. These guards comply with OSHA (Occupational Safety and Health Administration) and ANSI (American National Standards Institute) safety standards.

A portable demonstration unit is available. This unit features various materials that are used to construct a shield or guarding system. This portable demonstration unit is ideal as a quick reference or as a visual aid for safety specialists, loss-control engineers, etc.

Please use Part No. FFD000263 when ordering.

INTRODUCTION TO BARRIER GUARDING SYSTEMS

Barrier guards are usually the first point-of-operation safeguard considered for machines. The guards detailed in this catalog are intended and designed to meet the requirements of OSHA (Occupational Safety and Health Administration) and ANSI (American National Standards Institute) safety standards.

The OSHA 29 CFR 1910.217 requirements on the next page are specifically for guards on mechanical power presses; however, the same requirements apply for any other machinery used in industry.

When reviewing this catalog, please note guards are mounted on many different types of machines. These guards are not limited to fabricating equipment; they can be applied to any machine that requires point-of-operation safeguarding.

The EX-AL™ guarding systems can be used as a barrier (not guard) to protect the sides and rear of the machine when other safeguarding is used such as presence-sensing devices, two-hand control, pullbacks, and restraints.

An EX-AL™ guarding system can also be applied as shields on metal-cutting machines such as lathes, milling machines, and drill presses. This system is ideal for applications which require shielding from chips and coolant. At the same time, the shield provides a barrier between the point-of-operation hazard and the operator for added protection.

When operating any machine, personal protective equipment, including safety glasses, must be worn by the operator. All parts of the operator’s body must be kept out of the point-of-operation hazard and the operator must not wear jewelry. Long hair must be restrained and loose clothing should be avoided.

Each EX-AL™ guarding system offered in this catalog is custom designed and built for each application. Frame extrusions are cut and assembled from detailed dimensions furnished to the factory on measurement forms, prints, or sketches. Delivery varies from stock (inventoried brackets, fasteners, etc.) to four weeks based on the quantity and complexity of the guards required.

An instruction manual, danger signs, and a CAD-generated drawing are included with each EX-AL™ shipment. This information is helpful when mounting the guard to the machine. When a measurement form has been provided for the design and fabrication of the guarding system, a copy of it will be included with the shipment of the guarding system.

Before measuring your machine for barrier guards, please refer to the following pages to select the proper guard. Take into consideration the safety and productivity requirements of each machine.

Barrier guards basically consist of three components:

1. Panels
2. Panel segments
3. Mounts

Once the decision has been made on these three components and the OSHA requirements have been read and understood (see next page), someone can measure the machine(s) for the appropriate type of guard.
OSHA GUARD REQUIREMENTS TAKEN FROM 29 CFR 1910.217
FOR MECHANICAL POWER PRESSES

(c)(2) Point-of-Operation Guards:

(i) Every point-of-operation guard shall meet the following design, construction, application, and adjustment requirements:

(a) It shall prevent entry of hands or fingers into the point of operation by reaching through, over, under or around the guard;

(b) It shall conform to the maximum permissible openings of Table O-10;

(c) It shall, in itself, create no pinch point between the guard and moving machine parts;

(d) It shall utilize fasteners not readily removable by operator, so as to minimize the possibility of misuse or removal of essential parts;

(e) It shall facilitate its inspection, and

(f) It shall offer maximum visibility of the point of operation consistent with the other requirements.

(ii) A die enclosure guard shall be attached to the die shoe or stripper in a fixed position.

(iii) A fixed barrier guard shall be attached securely to the frame of the press or to the press plate.

(iv) An interlocked press barrier guard shall be attached to the press frame or bolster and shall be interlocked into the press clutch control so that the clutch cannot be activated unless the guard itself, or the hinged or movable sections of the guard are in position to conform to the requirements of Table O-10.

(v) The hinged or movable sections of an interlocked press barrier guard shall not be used for manual feeding. The guard shall prevent opening of the interlocked section and reaching into the point of operation prior to die closure or prior to the cessation of slide motion. See paragraph (c)(3)(ii) of this section regarding manual feeding through interlocked press barrier devices.

(vi) The adjustable barrier guard shall be securely attached to the press bed, bolster plate, or die shoe, and shall be adjusted and operated in conformity with Table O-10 and the requirements of this subparagraph. Adjustments shall be made only by authorized personnel whose qualifications include a knowledge of the provisions of Table O-10 and this subparagraph.

Explanation of above diagram:

This diagram shows the accepted safe openings between the bottom edge of a guard and feed table at various distances from the danger line (point of operation). A guard-opening scale can be used to check the openings in a guard after installation (see next page).

The clearance line marks the distance required to prevent contact between the guard and moving parts.

The minimum guarding line is the distance between the infeed side of the guard and the danger line which is one-half inch from the clearance line.

The various openings (based on a woman’s size 6 glove) are designed to prevent the operator’s fingers from reaching the point of operation.

After installation of point-of-operation guards and before a machine is released for production, a check should be made to verify that the guard will prevent the operator’s hands from reaching the point of operation.

Table O-10 shows the distances that guards shall be positioned from the danger line in accordance with the required openings.

Note: The standard panel is furnished with ¼” diameter rods or hairpins that are on ¾” centers; therefore, they will be ½” apart. 2½” is the minimum distance the panels can be mounted from the point of operation. The same 2½” distance applies to the standard ¼” square mesh.
OSHA AND ANSI GUARD-OPENING SCALES

These guard-opening scales are used to check the openings in a guard once it has been installed.

GENERAL INSTRUCTIONS FOR APPLYING BARRIER GUARDS

A barrier guard consists basically of three components: PANELS, PANEL SEGMENTS (if required), and MOUNTS.

PANELS
1. Begin by determining what type of panel construction is required. Choices include a nonadjustable panel (NAP), or a variety of adjustable panels (AP1, AP2, AP3, AP4, AP5, and AP1).
2. Next, using a plain piece of paper or the measurement forms provided, measure accurately and record the sizes of each panel required. Important: All dimensions and information requested on each measurement form must be filled in and answered completely. Be sure to read the measuring instructions for each type of guard before writing down the dimensions.

PANEL SEGMENTS
3. Determine if a segment inside the panel is required. If it is, decide which segment type.
4. Measure the segment size required and provide its location in the panel.
5. On some smaller guards, the segment could be the entire panel.

MOUNTS
There are various mounts available for attaching the guard to the machine. Select the mount that best fits the application.

For price quotes or ordering, remember to:
1. Complete all dimensions for each barrier guard.
2. Measure accurately and complete all dimensions. Important: All dimensions and information requested on each measurement form must be filled in and answered completely. Note any machine obstructions, such as flywheel covers, knockout rods, feeds, and moving machine components on the measurement form and provide specific dimensions of these obstructions in the Notes section.
3. Send the completed information to Rockford for pricing.
4. When ordered, a complete barrier guard, ready for installation, will be furnished.

Note: The barrier guards and/or mounting brackets/stands in this catalog will be fabricated to within ± 1/8" of the measurements provided. Minor modification or additional material may be needed at the time of installation for proper fit to the machine or equipment.
PANELS

The standard panel frame is constructed of 1” x 2” extruded aluminum. The nonadjustable area of the panel is made of black or yellow mesh (¼” sq. 16-gauge or 1” sq. 12-gauge), or ⅜”-thick clear polycarbonate which is fastened in place for a permanent assembly. A panel can also be furnished with adjustable ⅛” diameter, black-oxidized steel hairpins in any portion of the panel. This provides adjustability for strip or coil feeding, or for obstructions on the machine. The hairpins are secured to the panel frame with clips, T-nuts, and socket-head cap screws.

Various types of panel segments can also be furnished in the nonadjustable area of the panel to accommodate required features. A panel with adjustable hairpins does not have a panel segment unless the operator requires visibility into the point of operation. Panels can be attached to the machine using the mounts shown on pages 9 and 10.

PANEL FRAME CONSTRUCTION

NAP—NONADJUSTABLE PANELS

The NAP panel is fastened in place for a permanent assembly. It can be furnished with ⅜” or 1” black or yellow mesh, or ⅛”-thick clear polycarbonate.

1⁄2” MESH PANEL

AP—ADJUSTABLE PANELS

AP1—Lower Section (½ Frame)

The AP1 panel has a sturdy frame around the top half of the nonadjustable panel area. Steel hairpins are on the lower portion of the panel to allow for adjustability.

AP2—LOWER SECTION (5⁄8 FRAME)

The AP2 panel has adjustability on the lower section, with one side of the frame extending to the bottom of the panel for an extended mounting surface.

AP3—LOWER SECTION (3⁄4 FRAME)

The AP3 panel has adjustability on the lower section, with both sides of the frame extending to the bottom of the panel for an extended mounting surface on both sides.

POLYCARBONATE PANEL
PANEL FRAME CONSTRUCTION (CONTINUED)

AP4—INTERIOR SECTION (FULL FRAME)
The AP4 panel has steel hairpins located in the interior section of the panel for adjustability. This can be used when the material is fed through the center portion of the panel.

AP5—LOWER SECTION FULL FRAME
The AP5 panel has adjustability on the lower section, with full-frame availability for mounting.

API—LOWER SECTION (INCLINABLE)
The API panel has inclinable steel hairpins located in the lower section. The inclinable section slants the hairpins inward for effective feeding of material and accommodation of various size dies while providing point-of-operation safeguarding. When inclining these guards, refer to the requirements of Table O-10 (see page 5) for the proper size opening.

PANEL SEGMENTS

Various types of panel segments can be positioned into the nonadjustable area of the framed panel to accommodate required features. A standard panel with adjustable hairpins does not have a panel segment unless the operator requires visibility into the point of operation.

FEEDING (FS)
The feeding segment is used for strip or coil feeding through a nonadjustable area of the panel. This segment can accommodate various feedline heights.

ADJUSTABLE (AS)
The adjustable segment is used for strip or coil feeding through an adjustable area. This segment can accommodate various feedline heights. When using this adjustable segment, refer to the requirements of Table O-10 (see page 5).

POLYCARBONATE (PCS)
Polycarbonate (3/16”-thick) segments are furnished when greater visibility into the point of operation is required.

EMPTY (ES)
An empty segment can be furnished to allow the user to exchange custom-built panel segments based on production requirements. When using this type of segment, refer to the requirements of Table O-10 (see page 5).
MOUNTS

Various mounts are available which attach the barrier guards to the machine. (Please see illustrations throughout this catalog.) The mounts are furnished with all required components to mount and fasten the barrier guard to the machine.

SINGLE-PANEL BARRIER GUARD MOUNTS

DFM (Direct Frame Mount) Assembly
Part No. FKT683 (Black Steel) - Mount
Park No. FKT656 (Aluminum) - Guard or Post Mount

The DFM (direct frame mount) assembly (set of four with fasteners) attaches a guard panel to a flat surface on the machine. The slotted hook-mount allows the guard panel to be lifted off the machine without removing the fastener.

EM (Extended Mount) Assembly
Part No. FKT608–3”
Part No. FKT609–5”
Part No. FKT610–7”

The EM (extended mount) assembly (set of four with fasteners) connects a panel up to 3”, 5”, or 7” out from the machine frame. The extended mount is ideal for machines that have obstructions, an irregular mounting surface, or requirements for the panel to be mounted at a specific location.

EM24 (Extended Mount) Assembly
Part No. FKT695

This assembly consists of a set of four with fasteners. It connects a panel 8” to 24” out from the machine frame. The EM24 mount is ideal for mounting a panel to machines with obstructions that require a panel to be mounted at a greater distance than the EM described above. DFM (direct frame mounts) are included with this assembly.

IFM (Inside Frame Mount) Assembly
Part No. FKT684–Two-Hole
Part No. FKT690–Four-Hole

The IFM (inside frame mount) assembly (set of four with fasteners) has a right angle bracket that fastens a guard panel to the inside column or frame of the machine. The IFM assembly is used when there are obstructions on the outside frame (face) of the machine, or for conveniently locating the guard between the machine frame, closer to the hazard. Depending on the size of the panel, either a two-hole (under 10” square) or four-hole (over 10” square) IFM assembly will be provided.

HM (Hinged Mount) Assembly
Part No. FKT686

The HM (hinged mount) assembly consists of two hinges, one latch, two 1” x 1” pieces of extrusion (length determined by dimensions furnished), and fasteners. DFM (direct frame mount), IFM (inside frame mount), or EM (extended mount) assemblies must be used with this assembly to connect the hinged hardware and panel to the frame of a machine.
MOUNTS (CONTINUED)

MOUNTS FOR MULTI-PANEL BARRIER GUARDS

The following assemblies are usually applied to gap-type machines. They are used when the side panels of XL2 through XL6 guards need to be hinged to the left and right. This hinged feature may be necessary when changing dies, making tooling adjustments, or freeing jammed workpieces.

**Side Frame Mount (SFM) Assembly**

**Part No. FKT682**

The SFM (side frame mount) assembly includes four right-angle brackets (either two-hole or four-hole brackets depending on the size of the panel) that connect a guard to a smooth, upright surface of a machine. Additional parts for the assembly include four hinges, two 1" x 2" extrusions, and other hardware.

**SFM24 (Side Frame Mount) Assembly**

**Part No. FKT680**

The SFM24 (side frame mount) assembly connects a barrier guard 8" to 24" out from the sides of the machine. This SFM24 mount is ideal for mounting a guard to a machine when the guard must extend out from the machine frame. Additional parts for the assembly include four hinges, two 1" x 2" extrusions, and other hardware.

**FFM (Front Frame Mount) Assembly**

**Part No. FKT681**

The FFM (front frame mount) assembly connects a barrier guard to the throat portion of a C-frame machine using right-angle brackets. This mount is applied when a multi-panel guard cannot be attached to the side of the machine using the SFM, SFM3, -5, or -7, or the SFM24 mounts described on this page. Additional parts for the assembly include four hinges, two 1" x 2" extrusions, and other hardware.

**SFM3, -5, or -7 (Side Frame Mount) Assembly**

**Part No. FKT677 SFM3**

**Part No. FKT678 SFM5**

**Part No. FKT679 SFM7**

The SFM3, -5 or -7 (side frame mount) assembly includes four extended mount assemblies that can be 3", 5", or 7" long. This mount is ideal for mounting a guard to a machine with an irregular surface, or to avoid obstructions at the mounting point. Additional parts for the assembly include four hinges, two 1" x 2" extrusions, and other hardware.
MULTI-PANEL XL2 THROUGH XL6

Multi-panel barrier guards can be furnished for various machines including gap or C-frame presses that require barrier guards as the method of safeguarding. Ideal applications include manual strip-feeding operations in single stroke or for automatic-feeding operations in the continuous or automatic single stroke modes of operation. The guards are custom-designed for each application to meet the requirements of OSHA (Occupational Safety and Health Administration) and ANSI (American National Standards Institute). Each guard consists of three components: panels, panel segments (if required), and mounts.

The panels of these barrier guards are available in nonadjustable (NAP) and adjustable (AP1, AP2, AP3, AP4, AP5, and API) frame construction. Various panel segments can be positioned into a nonadjustable panel to meet specific requirements. Please see page 8 for details on panel segments.

Normally, panels with adjustable hairpins do not have panel segments unless the operator requires visibility into the point of operation. Mounts are used to attach guards to the machine.

Normally, the framework of the panels is constructed of 1” x 2” square extruded aluminum. Larger frame extrusions are available (see page 27 for choices). Standard panels can be furnished with black or yellow mesh (1/2” sq. 16-gauge or 1” sq. 12-gauge), or 3/16”-thick clear polycarbonate. Panels are available with adjustable, black-oxidized steel hairpins in the lower portion of the panel. These hairpins provide adjustability for strip or coil feeding, or for going around obstructions on the machine. The adjustable hairpins are secured to the panel frame with clips, T-nuts, and socket-head cap screws.
MULTI-PANEL XL2 THROUGH XL6 (CONTINUED)

This page illustrates guards that are usually applied to C-frame machines. The two-panel and four-panel barrier guards cannot be considered a safeguard. They are to be used with safeguarding devices such as two-hand trip or control, presence-sensing devices, pullbacks, or restraints. They are designed to protect the sides of the point of operation while the front is open for feeding and removing of workpieces.

The three- and five-panel barrier guards are designed to meet the requirements of a point-of-operation guard as detailed on pages 5 and 6 of this catalog. The rear of the machine must also be guarded when applying front and side guards. A roof and/or floor section is required if the guard is designed and applied where someone could reach over or under it.

Model XL2—This two-panel guard can be constructed from any of the panels shown on pages 7 and 8. The mounts can be furnished as illustrated on pages 9 and 10. The barrier shown has two panels constructed of mesh and hairpins with SFM5 mounts.

Model XL3—This three-panel guard shows the same two panels as the XL2 with the addition of a front panel made of polycarbonate and adjustable hairpins.

Model XL4—This four-panel barrier guard is similar to the XL2 shown above with the addition of right rear and left rear panels. The XL4 barrier guard is used when the guard must extend out from the machine frame to provide clearance for the machine bed or tooling. This guard is constructed of polycarbonate and mesh panels and includes feeding and adjustable segments. SFM24 and FFM mounts are shown.

Model XL5—This five-panel guard shows the same four panels as the XL4 with the addition of a front panel. This panel is made of mesh and includes a polycarbonate segment.

Note: Model XL6 (not shown) consists of two XL3 barrier guards placed on top of each other with a gap in between them to allow for large sheet metal feeding.
The following instructions are for measuring XL2 through XL6 barrier guards. The basic information necessary to quote or fabricate any of the listed guards is the frame type, nonadjustable area construction, height and length of panel(s), panel segments (if required), and mounts to attach the guards to the machine.

The following instructions are purposely kept as simple as possible to avoid long explanations of the many variations available.

1. Fill in the complete heading as indicated.
2. Check appropriate guard model number.
   - XL2 = 2 panel
   - XL3 = 3 panel
   - XL4 = 4 panel
   - XL5 = 5 panel
   - XL6 = 6 panel (gap style)
   (If any panels are not required, cross them out in the panel chart.)
3. Measure and record the bolster width and depth.
4. Measure web width of frame, if the barrier guard is to be mounted to the front of the frame behind the bolster plate.
5. Measure and record the outside width of the press frame behind the bolster plate.
6. Indicate desired position of each panel relative to the bolster. Drawing shows panels extended from the bolster. If panels should be inbound, enter minus (-) dimensions, or on the bolster, enter zero.
7. Measure and record the distance from the mounting point of the guard on the machine to the rear of the bolster, or back of press throat if using FFM mounts.
8. Measure and record the clearance from the flywheel cover to the top of the bolster. This dimension could affect the panel height if the panel is to be swung under the flywheel cover.
9. Measure and record the feedline depth if applying a gap type guard (XL6).
10. Enter the minimum and maximum feedline height if applying adjustable hairpins or inclinable panels.
11. Indicate mounts required.
   - SFM Side Frame Mount
   - SFM7 Side Frame Mount up to 7”
   - SFM24 Side Frame Mount up to 24”
   - FFM Front Frame Mount
12. Indicate frame type for each panel.
   - NAP Nonadjustable Panel
   - AP1 Adjustable Panel (1/2 frame)
   - AP2 Adjustable Panel (5/8 frame)
   - AP3 Adjustable Panel (3/4 frame)
   - AP4 Adjustable Panel (Full frame)
   - AP5 Adjustable Panel (Full frame)
   - API Adjustable Panel (Inclinable)

If adjustability is not required at the left and right front corners of the barrier guard, use AP3 panels for L and R, and AP1 panel for F for quicker removal of F panel.

If adjustability is required at the left and right front corners of the barrier guard, use AP2 panels for L and R, and AP1 panel for F and indicate in Notes section on the form. All panels (L, F, R) should have the same size nonadjustable area and it should be in the same position on all panels.

13. Indicate the construction of the nonadjustable area for each panel.
   - B 1/2” Sq. Black Mesh (16 gauge)
   - B1 1” Sq. Black Mesh (12 gauge)
   - Y 1/2” Sq. Yellow Mesh (16 gauge)
   - Y1 1” Sq. Yellow Mesh (12 gauge)
   - PC Polycarbonate (3/16”-thick)
14. Indicate height of each panel.
15. Indicate length of each panel.
16. Indicate panel Segment type, height, length, and if hinged or nonhinged.
   - FS Feeding Segment
   - AS Adjustable Segment
   - PCS Polycarbonate Segment
   - ES Empty Segment
17. Indicate which panel(s) require an interlock switch and if switch is locking or nonlocking.
18. Indicate if F panel needs to be hinged (L or R).
19. Indicate if hairpins are required in place of RR or LR panel. The number of hairpins supplied will be determined by the height of the L or R panel.
20. Indicate if roof section(s) are required. Provide height and length.
21. Indicate if floor section(s) are required. Provide height and length.
MEASUREMENT FORM FOR MULTI-PANEL MODELS XL2 THROUGH XL6

Multi-panel guards—XL2, XL3, XL4, XL5, XL6

If more than one machine is to be measured, please make copies of this page. (See previous page for instructions.)

The front-mount guarding system is applied to machines that usually have a gap-type construction with components that extend to the right or left of the point of operation. These components can be dies, tooling, feeds, scrap choppers, etc. The front-mount extrusion provides support for the guard across the front of the machine. The front portion of the machine can be safeguarded with one, two, or three panels (see the measurement form on page 17 for the LF, F, and RF panels).

If panels need to be removed or hinged, please indicate how they should be attached. When measuring for a front-mount guard and the construction of the panel is determined, a roof and/or floor section is required if someone can reach over or under the guard.

The panel length will be determined at the factory based on the information provided on the measurement form.
MEASURING INSTRUCTIONS FOR FRONT-MOUNT MODELS XL1 FM THROUGH XL7 FM

The following instructions are for measuring XL1 through XL7 front mount barrier guards. The basic information necessary to quote or fabricate any of the listed guards is the frame type, nonadjustable area construction, height of panel(s), panel segments (if required), and mounts to attach the guards to the machine. The length of all panels will be determined by Rockford Systems.

The following instructions are purposely kept as simple as possible to avoid long explanations of the many variations available.

1. Fill in the complete heading as indicated.

2. Check appropriate guard model number.
   - XL1 = 1 panel
   - XL2 = 2 panel
   - XL3 = 3 panel
   - XL4 = 4 panel
   - XL5 = 5 panel
   - XL6 = 6 panel
   - XL7 = 7 panel
   (If any panels are not required, cross them out in the panel chart.) Indicate how front mount will be attached to the press: direct, extended, or tie-bar boss.

3. Measure and record the bolster width and depth.

4. Measure and record the distance from the edge of the bolster to the outside of the frame of the machine on both sides.

5. Measure and record the distance from the mounting point of the guard on the frame of the machine to the rear of the bolster.

6. Indicate desired position of L, F, and R panels relative to the bolster. Drawing shows panels outbound of the bolster. If panels should be inbound, enter minus (-) dimensions, or on the bolster, enter zero.

7. Indicate the distance of the LR and RR panels to the mounting point on the frame of the machine.

8. Enter the center to center distance of tie-bar bosses or extended mount locations and distance from the right edge of the bolster to the center of the right tie-bar boss or right extended mount.

9. Measure and record the distance from the edge of the bolster to the right edge of the LF panel and the left edge of the RF panel. If the edge of the panel(s) is on the bolster, enter zero. If there is no LF or RF panel(s), put an “X” in the square.

10. Enter the minimum and maximum feedline heights.

11. Indicate mounts required for LR, L, R, or RR panels.
   - SFM Side Frame Mount
   - SFM7 Side Frame Mount up to 7"
   - SFM24 Side Frame Mount up to 24"
   - FFM Front Frame Mount

12. Measure and record the distance from the top of the Front Mount to the top of the bolster.

13. Enter the distance between the bottom of the front panel(s) to the top of the Front Mount.

14. Indicate frame type for each panel.
   - NAP Nonadjustable Panel
   - AP1 Adjustable Panel (1/2 frame)
   - AP2 Adjustable Panel (5/8 frame)
   - AP3 Adjustable Panel (3/4 frame)
   - AP4 Adjustable Panel (Full frame)
   - AP5 Adjustable Panel (Full frame inclinable)
   - API Adjustable Panel (Inclinable)

15. Indicate the construction of the nonadjustable area for each panel.
   - B 1/2” Sq. Black Mesh (16 gauge)
   - B1 1” Sq. Black Mesh (12 gauge)
   - Y 1/2” Sq. Yellow Mesh (16 gauge)
   - Y1 1” Sq. Yellow Mesh (12 gauge)
   - PC Polycarbonate (3/16”-thick)

16. Indicate height of each panel.

17. Indicate length of each panel. Rockford Systems will determine length(s) based on other dimensions provided.

18. Indicate panel segment type, height, length, and if hinged or nonhinged, if required.
   - FS Feeding Segment
   - AS Adjustable Segment
   - PCS Polycarbonate Segment
   - ES Empty Segment

19. Indicate which panel(s) require an interlock switch and if switch is locking or nonlocking.

20. Indicate if L, LF, F, RF, or R panels need to be hinged (L or R).

21. Indicate if hairpins are required in place of LR or RR panel. The number of hairpins supplied will be determined by the height of the L or R panel.

22. Indicate if roof section(s) are required. Provide height and length.

23. Indicate if floor section(s) are required. Provide height and length.

SINGLE-PANEL MODEL XL1 OR DOUBLE PANEL MODEL XL2

The single-panel barrier guard can be furnished for any machine that requires simple, one-sided guarding. The panel can be custom designed for each application. In some applications, it is more convenient to have a double panel (split guard) with two panels in line with each other that are hinged and latched. Applications include areas of the machine not protected by a light curtain—front, rear, sides of the machine, or for auxiliary guarding.

The framework of the panel is typically constructed of 1” x 2” square extruded aluminum. The fixed area of the panel is made of black or yellow mesh (½” sq. 16-gauge or 1” sq. 12-gauge), or ¼”-thick clear polycarbonate. It is fastened in place for a permanent assembly. Adjustable, black-oxidized steel hairpins are available for the lower portion of the panel. These hairpins provide adjustability for strip or coil feeding, or for going around obstructions on the machine. The adjustable hairpins are secured to the panel frame with hairpin clips, T-nuts, and socket-head cap screws. Various panel segments can also be positioned into a framed panel to meet specific requirements. Panels with adjustable hairpins normally do not have a panel segment unless the operator requires visibility into the point of operation.

A single-panel can be attached to the machine using any of the mounts described on the next page.
**MEASUREMENT FORM FOR SINGLE-PANEL MODEL XL1 OR DOUBLE PANEL XL2**

If more than one machine is to be measured, please make copies of this page.

Company __________________________ Address __________________________
City __________________________ State __________ Zip __________
Attention __________________________ Rep. __________________________
Machine Mfr. and Model No. __________ Machine No. __________
Measured By: __________________________

- **DFM (Direct Frame Mount) Assembly**
  - Mounting center distance will be approximately 2” greater than the overall panel length.

- **IFM (Inside Frame) Mount Assembly**
  - Panel length will be approximately the inside machine frame dimension.

- **EM (Extended Mount) Assembly**
  - Mounting center distance will be approximately 1” greater than the overall panel length.

- **HM (Hinged Mount) Assembly**
  - If hinging is required, order this HM (hinge mount) assembly along with one of the following: DFM, IFM, or EM.
  
  If Direct Frame Hinged Mounts are used, the mounting center distance will be approximately 4” greater than the overall panel length.

  If Inside Frame Hinged Mounts are used, the panel length will be approximately 2” less than the inside machine frame dimension.

  If Extended Hinged Mounts are used, the mounting center distance will be approximately 3” greater than the overall panel length.

**MEASURING INSTRUCTIONS**

This single-panel Model XL1 or double panel Model XL2 measurement form includes drawings of mounting situations. By entering dimensions and selecting the appropriate mounts, the barrier guard will mount easily to the machine.

1. Fill in the complete heading as indicated above.
2. Enter the MCD (mounting center distance).
3. Enter height and panel frame construction.
4. Enter panel construction for nonadjustable area.
5. Select appropriate mounts and check box(es) provided. If extended mounts are selected, check the distance the panel must be out from the mounting surface. Hollow studs will accommodate up to 7 inches.
6. Enter appropriate location of all mounts, especially if above and below the panel.
7. Enter panel segment location in panel (if applicable) and select type of segment.
8. Check type of electrical interlock switch, if any.

**Identify, dimension and locate desired panel segments or panel cutouts, if required, by sketching on blank panel drawing below.**

**Panel Segment Type**
- **Feeding (FS)**
- **Polycarbonate (PCS)**
- **Adjustable (AS)**
- **Empty (ES)**

**Electrical Interlock Switch and Bracket**
- **Locking**
- **Nonlocking**
- **None**
Lift-type guards, either spring lift or air lift, can be furnished on machines where guards need to be quickly and easily positioned up out of the way for die setup and maintenance. These lift-type guards are custom designed for each application to meet the requirements of OSHA (Occupational Safety and Health Administration) and ANSI (American National Standards Institute) safety standards.

These barrier guards are available with non-adjustable panels (NAP), or a variety of adjustable panels (AP3, AP4, AP5, and AP1). Various panel segments can be located in the nonadjustable area of the panel to meet specific requirements. Panels with adjustable hairpins do not have panel segments unless the operator requires visibility into the point of operation. The lift-type barrier guards are attached to the machine by mounting the rails directly to the machine frame.

Usually, the panel framework of the guard is constructed of a rail and carriage assembly. The nonadjustable portion of the panel can be furnished with black or yellow mesh (1/8” sq. 16-gauge or 1” sq. 12-gauge), or 1/16”-thick clear polycarbonate. A panel can be furnished with adjustable steel hairpins. The hairpins provide adjustability for strip or coil feeding, or for obstructions on the machine. The adjustable hairpins are secured to the panel frame with clips, T-nuts and socket-head cap screws.

This style of guard can also be furnished for horizontal operation rather than vertical operation as illustrated. Please contact the factory for details on horizontal applications.
The spring-lift and air-lift guards are usually applied to a machine that has straight vertical sides with a point of operation that needs to be guarded. The mechanical motor springs on the spring-lift guard provide a counterbalance for the weight of the guard. This allows the guard to move upward from the guarded position to access the point of operation.

The air-lift guard is usually applied to larger machines. With this system, the guards are raised and lowered by air cylinders (2) and operating cables that are attached to the guard. A separate key-operated selector switch station controls the movement of the guard. This selector switch operates a solenoid which controls the air cylinders. The solenoid has a built-in check valve to keep the guard from dropping if air pressure is lost.

The spring-lift and air-lift guards are not designed for manual feeding operations. For manual feeding operations using gates, please consult the factory.

12. Notes:

MEASURING INSTRUCTIONS

The lift guard measurement form is designed to be used for the XL1 SL and XL1 AL guards.

1. Fill in the complete heading as indicated.
2. Check whether an Outside or Inside mount is required. (See lower left side of front view drawing for examples.)
3. Enter outside rail dimension; or
4. Enter panel length. If outside rail dimension is specified, it will dictate the panel length and vice versa. (See note.)
5. Enter panel height, frame type, and construction of nonadjustable area.
6. Enter lift height. This will usually be the same as panel height.
7. Enter upper and lower rail limits, if any.
8. If outside mounted, enter the appropriate location of upper and lower mounting point for each rail. These dimensions plus the panel height and lift height will help determine the length of the rails.
9. Enter the desired length of the four rail supports. Allow for any obstructions (7" min. for air lift only).
10. Enter dimensions and information for panel segments and/or side guards as required.
11. Check type of electrical interlock switch, if any.
INTRODUCTION TO PERIMETER GUARDING SYSTEMS

Perimeter safeguarding is used in numerous applications in manufacturing: around robots and robot systems, assembly machines, packaging machines, transfer lines, cut-to-length lines, sitting lines, etc. It is also applied in a diverse number of industries such as printing, bottling, food processing, textiles, and petroleum products.

When safeguarding the perimeter area around a machine or process, the safeguarding must prevent access to the hazard or cause the hazard to cease. To protect individuals that work in or around large work areas, several choices of primary safeguarding are available under these categories:

1. **Barrier guards** are physical barriers that prevent access to the hazard.

2. **Presence-sensing devices**, such as light curtains, single- or multiple-beam devices, area scanners, radio-frequency devices, and pressure-sensitive mats, detect the presence of a person and stop the hazardous motion of the robot or machine.

3. **Hostage controls** can be applied where an application requires that a control be held actuated while the machine is running. Two-hand controls, or a single-hand or foot control, can be used for this. A hostage control must be fixed in position at the proper safety distance to keep the operator at a safe distance from the hazard. However, hostage controls only protect the individuals using them, so other safeguarding must be provided for other personnel that are exposed to the hazard.

Additional supplemental safeguarding can be applied with the use of awareness barriers, awareness signals (audible or visual), warning signs, and color-coding. Safety procedures and personal protective equipment can also play a role in protecting individuals.

Risk assessment and hazard analysis should be done before applying safeguards to a perimeter application. First, identify the hazards; second, identify the risk that individuals will be exposed to around the machine and equipment. Lastly, decisions must be made as to what tolerable risk remains when running production, setting up, and maintaining the machine and equipment.

Two safety standards in North America are usually referenced when applying perimeter safeguarding:

Both standards require that safeguards are designed, constructed, attached, and maintained so that personnel cannot reach over, under, around, or through the guard or device undetected and reach the hazard.

Barrier guards must prevent access to a hazard. They must be constructed with materials (such as steel or aluminum) that will hold up to the environment and application, and must not themselves create a hazard.

If openings are needed in a guard, the openings must comply with the guard-opening table in the standards. Any fixed portion of a guard must require the use of tools to be adjusted or removed. If the possibility exists that some object, workpiece, etc., can be ejected from the hazard area, the barrier guard must contain these objects.

The requirements for barrier guards are the same in both the ANSI/RIA and CSA standards. The only difference is in the minimum height requirements of the bottom and top of the guard above adjacent walking surfaces.

ANSI/RIA R15.06 requires that the bottom of the guard be no more than 12 inches above adjacent walking surfaces and that the top of the guard be no lower than 60 inches above adjacent walking surfaces unless additional safeguarding devices are installed to prevent or detect access to the hazard.

CSA Z434 has the same language except the dimensions are 6 inches for the bottom of the guard and 72 inches for the top of the guard above adjacent walking surfaces.

When barrier guards have interlocked sections, each section must provide two sets of contacts unless the risk assessment determines one set of contacts is acceptable. If magnetic switches are used, they must be magnetically coded to reduce the possibility of defeat or interference. Switches designed with a positive opening operation must be mounted in a positive mode so that when the actuator is disengaged, the motion forces a nonresilient linkage to open the closed contact(s) tied in to the safety-stop circuit.

Switches other than positive-opening switches must be automatically monitored to detect faults with the switches or their installation. The interlocking device must not be used as an end-of-travel stop. It must be tamper-resistant and unable to be defeated without tools, and it must be capable of being easily unlocked from the inside of the safeguarded area with or without power available (when the possibility of full body access exists). The device must be interfaced to the safety-stop circuit so that the robot or machine cannot be placed in automatic operation until the interlocked guard is closed. When the guard is opened, a stop signal must be given by the device, and closing of the guard must not, by itself, restart automatic operation—automatic operation must require a deliberate action outside the safeguarded area.

To ensure that an individual is out of the hazard area so that automatic operation cannot be accidentally restarted by someone else, the interlocking system should require a key, password or security code from that individual before permitting restart. For special interlock controls, please consult the factory for details.

*American National Standards Institute/Robotic Industries Association
†Canadian Standards Association
MEASURING PERIMETER GUARDS

The aluminum perimeter guarding systems offered in this catalog consist of aluminum panels and posts. The mounting hardware and distances between components are shown below. Please refer to the following drawings when measuring.

The standard panels are furnished in widths of 18”, 24”, 30”, and 36”. Standard doors are either 30” or 36” wide. Special panels and doors are available upon request; please consult the factory.

The L-shaped panel-to-post connector shown on page 26 will allow the panel to be positioned anywhere within 180° of the post. This allows the panel to be at an angle from the post, which makes installation easy at corners.
**ALUMINUM PANELS, DOORS AND POSTS**

The aluminum panels are constructed of 1” square aluminum frames with a T-slot on all four sides. The material in the center portion of the panel can be 1” or 2” square black mesh, 1” square yellow mesh, or 3/16”-thick clear polycarbonate.

The mesh is held in the frame with clamps and the polycarbonate is held in place with a rubber gasket.

The standard panels are furnished in widths of 18”, 24”, 30”, and 36”. Standard heights are 48” (60” height from the floor) and 66” (72” height from the floor). This provides a 6” sweep under the 66” high panel and a 6” sweep under the 72” high panel. Other center materials and special-size panels are available upon request.

The outside door frame is constructed of 2” square aluminum with two T-slots on each side. The frame sits in the same foot described above and the door posts are fastened together at the top for stability. The height under the door frame is 84”.

The door is constructed of a 1” x 2” aluminum frame. The center portion is available in 1” or 2” square black mesh, 1” square yellow mesh, or 3/16”-thick clear polycarbonate. Special doors and center material are available upon request.

The aluminum posts are constructed of 2” square aluminum with two T-slots on each side. The standard posts are 60” or 72” high. Special-height posts are available upon request.

The foot for the post is 6” square with four holes on 4½” centers. The foot is constructed of steel.

For more information about our customized perimeter guarding systems, please contact a machine safeguarding specialist.
### HARDWARE

#### PANEL-TO-POST CONNECTOR

**Part No. STL013 Panel-to-Post Connector**

The connector assembly for attaching a panel to a post consists of two right-angle steel brackets. One bracket has an elongated slot and the other has a tapped hole. A fastener with nut is included.

#### HINGE FOR ALUMINUM DOOR

**Part No. FKT584 Hinge**

This steel hinge measures 2” x 2”. Four hinges are furnished on each door.

#### DOOR STOP FOR ALUMINUM DOOR

**Part No. FKT595 Door Stop**

The door stop is made of aluminum. Two are furnished for each door.

### INTERLOCKING DOOR BOLTS

Interlocking door bolts are made of steel and aluminum components. The sliding type slides back and forth to latch the door closed and provides a guide for the interlock switch. The back side of the assembly has a knob to slide the bolt open if someone is inside the guard and the bolt is latched. It is available for both hinged and lift-off doors. The fixed type is available for sliding doors. Special latch hardware for other interlock switches is available upon request.

*Note: These interlocking door bolts do not include a safety interlock switch.*

For use with Safety Switches 6025060, 6022580, 6025067, and 6025073

EXTRUSIONS

This page illustrates cross sections of the various extruded aluminum sizes that are available. Most of the guards and barriers offered in this catalog use the 1” square, 1” x 2”, 1 1/2” square, or 2” square sizes. Larger sizes are available for guards, fixtures, mounting brackets, machine bases, furniture, or anything that requires this type of material for its design and construction. Extrusions are in stock in 12-foot lengths; however, longer lengths are available up to 20 feet. The extrusions are made of strong, lightweight 6105-T5, clear anodized, #204-R1 aluminum.

MATERIAL SPECIFICATIONS
• Yield strength 35,000 lb/in² minimum
• Tensile strength 38,000 lb/in² minimum
• Elongation A5 minimum 10%
• Elongation A10 minimum 8%
• Rockwell hardness approximately E-88
• Extrusion conforming to DIN 17 615 specifications

- Twist per foot of length not to exceed .25 degree and total twist over 20 feet of length not to exceed 1.5 degrees
- Flatness .004” per inch of width
- Straightness 0.0125” per foot of length, not to exceed .120” over 20 feet of length
- All extrusions have etch and clear (204-R1) anodizing with depth of .004” and surface hardness of approximately 250 HV
MESH

The nonadjustable area of a panel can be constructed of black or yellow mesh (1/2” square 16 gauge, 1” square 12-gauge, or 2” square 16-gauge). Usually, the 1/2” square mesh is used for point-of-operation guards and the 1” or 2” square mesh is used for large work envelope (perimeter) safeguarding. The mesh is made of PVC-coated carbon steel which is rust resistant. Black mesh provides better visibility into the point of operation. Mesh can be ordered in any size up to 48 x 96 inches. Please provide dimensions when ordering.

POLYCARBONATE

PART NO. SHTPLYCLR177 (PER SQ. INCH)
PART NO. FKT1035 (4’ X 8’)
The nonadjustable area of a panel can be constructed of clear polycarbonate. Polycarbonate is ideal when high visibility is required. It is also useful for containing chips, sparks, and coolant.
The polycarbonate is 3/16”-thick and can be mounted in extruded-aluminum frames with rubber gaskets (see below). Please provide dimensions when ordering; sizes available up to 48 x 96 inches.

T-SLOT COVERS

These T-slot covers snap into the T-slots of the extruded aluminum. They keep dust and dirt out and wires in place.
T-NUTS

T-nuts allow joining plates, panels, hinges and other accessories to be bolted into the T-slot of any of the extrusions. They are made of hardened steel and are coated with corrosion-resistant black oxide. Standard T-nuts slide into the T-slot from the end.

The drop-in style allows the T-nut to be dropped into the slot after the extrusions have already been fastened together. T-nuts are usually fastened to button-head cap screws.

END FASTENERS

The end fastener provides a concealed method for connecting extrusions at 90° without external joining plates. The end fastener creates a tight, square joint. These fasteners consist of a stamping that aligns the T-slots and a button-head cap screw that threads into the tapped extrusion end. The end fastener is ideal for tight space restrictions. When loosened, connected extrusions glide smoothly over end fasteners. When connecting extrusions, 1/4" drilled access holes are required to allow a hex wrench to reach the button-head cap screws. Access holes are drilled 1/2" from the end of the extrusion. Additional holes are drilled at 1" centers from the first hole.

HAIRPINS AND FASTENERS

The adjustable area of a panel consists of individual black-oxidized steel hairpins. These hairpins are 1/4" round rods on 3/4" centers (1" wide from outside to outside) which create a 1/2" opening between hairpins. Hairpins provide adjustability of the guard for going around conveyors, chutes, or other obstructions on the machine or robot.

The clip that secures the hairpin in place uses 1" of the total hairpin length, and the rounded tip uses 1/2". For this reason, add 11/2" to the adjustability required on the hairpin to obtain the proper hairpin length. Example: An 11" hairpin will have 91/2" of adjustability; a 20" hairpin will have 181/2" of adjustability, etc.

Clips and Fasteners

Each hairpin is secured to the panel frame with one clip, one socket-head cap screw, and one T-nut.

ROLLER BEARING ASSEMBLY
PART NO. FKT837

The roller bearing assembly is used on the spring- and air-lift guards shown on pages 20 and 21 of this catalog, and on gate assemblies. These bearings are available for guiding guards up and down or back and forth. The roller bearing assembly consists of a roller bearing, bearing plate, collar, and necessary hardware.

HINGES

PART NO. FKT687 (STANDARD)
PART NO. FKT671 (LIFT-OFF RIGHT)
PART NO. FKT670 (LIFT-OFF LEFT)

Hinges are used to swing guard panels and segments to the right or left. They are attached to the aluminum extrusion anywhere along the T-slot with button-head or socket-head cap screws and T-nuts (furnished). Standard aluminum hinges and lift-off hinges are available.

SWING-AWAY HINGE ASSEMBLY
PART NO. FKT655

This specially designed hinge assembly is used on the light curtain swing-away mounting brackets. The assembly consists of two plates with fasteners for the top and bottom of the swing-away bracket. The top plate has a ball lock pin that holds the side guard in position. These hinges are designed to allow the side panel to move forward or backward for light curtain safety distance adjustment. Please use Part No. FKT655 for ordering one right or left swing-away hinge assembly.

Note: Both lift-off assemblies consist of five hinge parts plus fasteners.
DEADBOLT LATCH
PART NO. FKT620
A deadbolt latch is ideal for holding guard doors closed. This spring-loaded deadbolt is made of anodized aluminum. A socket-head locking set-screw located towards the end of the latch requires the use of a tool to open the guard. This feature complies with OSHA 29 CFR 1910.217 (c)(2)(d). This deadbolt with side latch includes all mounting hardware.

T-HANDLE HEX WRENCHES
The T-handle hex wrench is an ideal way to tighten and loosen button-head cap screws and socket-head cap screws. The handle has a cushion grip and the long arm provides access to hard to reach areas. The end of the hex wrench is ball-shaped which allows for angle entry up to 25°. Two sizes are available.

BRACKETS FOR INTERLOCK SWITCHES
EXAL0016 is a universal kit for mounting interlock switches to extrusions and latch assemblies, using aluminum plate and angle. Drilling and tapping for the switch components is required.
For switch-specific mounting kits or switch selection for a specific application, contact Rockford Systems at 1-800-922-7533 or email customerservice@rockfordsystems.com.

Universal Interlock Switch Mounting Bracket Kit
EXAL0016
A variety of brackets, plates, clamps, bolts, bearings, rollers, etc., are available for attaching guards to machines and for guard assemblies. Joining plates are used to connect extruded panels without additional machining.

FLOOR STAND
PART NO. KTR077

When light bars (transmitter or receiver) cannot be conveniently mounted to the machine, a floor stand can be furnished. Floor stands can also be used when safeguarding large work envelopes or perimeter areas. Mirrors or single-beam devices can be attached to the floor stand when the application requires multiple-sided safeguarding. Light bars, single-beam devices, or mirrors can easily be adjusted up or down on any side of the upright extruded-aluminum stand.

This floor stand assembly consists of a 6’ length of 2” square extruded aluminum, one base, and two right-angle brackets with fasteners. The base has four holes for permanent attachment to the floor with bolts (not furnished). Other floor stand sizes are available. Please consult the factory.

CONTROL BOX STANDS

When a control box cannot be conveniently mounted to the machine or the machine has excess vibration, rigid and adjustable control box stands are available. These stands are made of extruded aluminum and have base plates to permanently attach to the floor with bolts (not furnished).

Adjustable stands are available in models with height adjustment, and are also available in models with tilt adjustment for operator comfort.

FUNCTION-TESTING CHECKLIST FOR PERIMETER BARRIER GUARDS

This is a generic function-testing checklist. Your barrier guard may have other features that require different tests. Please refer to your barrier guard installation manual.

If the barrier guard is interlocked, make sure that the interlock device has been interfaced properly to the machine’s control system to provide control reliability (if required, based on the risk assessment).

**DANGER** Never place your hands or any part of your body in the hazard area while performing these tests.

Always perform these tests at every setup, operator, and shift change, as well as every time after maintenance is performed.

1. Make sure that the barrier guard is designed and constructed so that someone cannot reach over, under, around, or through the barrier guard and reach the hazard. Additional guards or safeguarding devices must protect all areas not protected by the barrier guard.
2. If there are openings in the barrier guard, check the openings for compliance with the ANSI/RIA* and CSA† guard-opening requirements. (See next page.)
3. Verify that the barrier guard is designed and constructed of materials substantial for the application to protect individuals from identified hazards. If the possibility exists that some object, workpiece, etc., can be ejected from the hazard area, confirm that the barrier guard will contain these objects.
4. Make sure that any fixed portion of the barrier guard must require the use of tools to be adjusted or removed.
5. Confirm that the barrier guard is fixed in position.
6. Check that the barrier guard is free of sharp edges and projections that may cause injury to individuals when handling, removing, or using the barrier guard.
7. Make sure that the barrier guard is installed, maintained, and operated such that it does not create any pinch points between itself and moving parts of the machine or robot.
8. Verify that the barrier guard provides adequate visibility to the point of operation, if required, with material such as perforated metal, wire mesh, or transparent polycarbonate. If visibility is provided through perforations or slots, the color of the material should be darker than the area observed to enhance visibility.
9. Check that the bottom of the guard is no more than 12 inches above adjacent walking surfaces and the top of the guard is no lower than 60 inches above adjacent walking surfaces.

Note: CSA Z434-03 uses dimensions of 6 inches for the bottom of the guard and 72 inches for the top of the guard.

10. If the barrier guard has one or more interlocked sections, perform the following tests for each interlocked section.
    a. Check that the interlocked section opens laterally or away from the hazard, and not into the safeguarded space, and cannot close by itself and activate the interlocking circuitry.
    b. With the machine on and ready to be cycled in a production mode of operation, open an interlocked section of the barrier guard and attempt to cycle the machine. The machine should not cycle.
    c. An interlocked section must either (1) prevent opening until hazardous motion has stopped (with a locking interlock device), or (2) be located at the proper safety distance so that when it is opened, an individual cannot reach the hazard before hazardous motion has stopped (with a nonlocking interlock device).

    (1) **Locking:** With all interlocked sections of the barrier guard closed while the machine is cycling, attempt to open an interlocked section. The interlocked section should not open. A locking interlocked section must open only when the hazardous motion of the machine has stopped after a normal stop command.

    (2) **Nonlocking:** With all interlocked sections of the barrier guard closed while the machine is cycling, open an interlocked section. The machine should stop before someone can reach the hazard.

---

*American National Standards Institute/Robotic Industries Association
†Canadian Standards Association
FUNCTION-TESTING CHECKLIST FOR PERIMETER BARRIER GUARDS (CONTINUED)

d. Verify that reclosing of an open interlocked section does not, by itself, cause any hazardous motion of the machine. Restarting of the machine must require a deliberate action outside the safeguarded area. To ensure that an individual is out of the hazard area so that automatic operation cannot be accidentally restarted by someone else, the interlocking system should require a key or a unique password or security code from that individual before permitting restart.

e. Verify that the interlock device will not be adversely affected by the environmental conditions.

f. Make sure that the interlock device is tamper-resistant and unable to be defeated without tools.

g. Confirm that the interlock device is not used as an end-of-travel stop for the interlocked section of the barrier guard.

h. Verify that the interlock device has two sets of contacts (unless the risk assessment determined that one set of contacts was acceptable). If the interlock device is a magnetic switch, make sure that it is magnetically coded to reduce the possibility of defeat or interference. Confirm that if the interlock device is a switch designed with a positive opening operation (cam-operated switching element), it is mounted in a positive mode so that when the actuator is disengaged, the motion forces a linkage to open the closed safety contact(s). If the interlock device is a switch other than a positive-opening switch (magnetic switch, limit switch, etc.), check that it is automatically monitored to detect faults with the switch or its installation.

i. Confirm that the interlock device is capable of being easily unlocked from the inside of the safeguarded area with or without power available (when the possibility of full body access exists).

j. Make sure that spare keys and actuating devices are supervisory-controlled and not readily available for the purpose of defeating the safeguard.

11. If any of these function tests fail, take corrective action before running production. If all tests pass, remove all keys from the selector switches before running production.

ANSI/RIA AND CSA GUARD-OPENING REQUIREMENTS

The minimum distance from the hazard as a function of barrier opening size as required by Table 5 of ANSI/RIA R15.06-1999, Industrial Robots and Robot Systems—Safety Requirements, and by Table 5 of CSA Z434-03, Industrial Robots and Robot Systems—General Safety Requirements, is as follows:

<table>
<thead>
<tr>
<th>Barrier Opening Size (Smallest Dimension)</th>
<th>Minimum Distance From Hazard</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Slotted opening</td>
</tr>
<tr>
<td>0.0–6.0</td>
<td>≥ 13.0 mm* [0.5 in]</td>
</tr>
<tr>
<td>6.1–11.0</td>
<td>≥ 64.0 mm [2.5 in]</td>
</tr>
<tr>
<td>11.1–16.0</td>
<td>≥ 89.0 mm [3.5 in]</td>
</tr>
<tr>
<td>16.1–32.0</td>
<td>≥ 166.0 mm [6.5 in]</td>
</tr>
<tr>
<td>32.1–49.0</td>
<td>≥ 445.0 mm [17.5 in]</td>
</tr>
<tr>
<td>49.1–132.0†</td>
<td>≥ 915.0 mm [36.0 in]</td>
</tr>
</tbody>
</table>

*Barriers shall not be located less than 13.0 mm (0.5 inches) from the hazard.
†Barrier openings shall not be greater than 132.0 mm (5.0 inches) unless a risk assessment is performed.

SAFETY DISTANCE FOR NONLOCKING INTERLOCKED BARRIER GUARDS

The safety equation for nonlocking interlocked barrier guards from Table 6 of ANSI/RIA R15.06-1999, Industrial Robots and Robot Systems—Safety Requirements, and from 10.4.3b of CSA Z434-03, Industrial Robots and Robot Systems—General Safety Requirements, is as follows:

\[
D_s = K(T_s + T_c + T_r)
\]

Where:

- \(D_s\) = safety distance that the interlocked section of the barrier guard must be located from the hazard
- \(K\) = maximum speed that an individual can approach the hazard (63 inches/second [1.6 meters/second] is commonly used)
- \(T_s\) = worst stopping time of the machine/equipment
- \(T_c\) = worst stopping time of the control system
- \(T_r\) = reaction time of the interlock device and its interface
FUNCTION-TESTING CHECKLIST FOR POINT-OF-OPERATION BARRIER GUARDS

1. Make sure that the barrier guard is designed and constructed so that someone cannot reach over, under, around, or through the barrier guard and reach the hazard. Additional guards or safeguarding devices must protect all areas not protected by the barrier guard.

2. If there are openings in the barrier guard, check the openings for compliance with the OSHA or ANSI guard-opening requirements. (See next page.)

3. Verify that the barrier guard is designed and constructed of materials substantial for the application to protect individuals from identified hazards.

4. Make sure that the barrier guard is designed, constructed, and maintained with fasteners not readily removable to protect against unauthorized adjustment or circumvention. Examples of fasteners that should not be used are slotted or Phillips head screws, wing nuts, magnets, latches and hasps, and hooks and eyes.

5. Confirm that the barrier guard is designed and constructed to ensure ease of use. If the barrier guard is overly large or cumbersome, it may discourage proper use.

6. Check that the barrier guard is free of sharp edges, burrs, slag welds, etc., that may cause injury to individuals when handling, removing, or using the barrier guard.

7. Make sure that the barrier guard is installed, maintained, and operated such that it does not create any pinch points between itself and moving parts of the machine.

8. Verify that the barrier guard provides adequate visibility to the point of operation, if required, with material such as perforated metal, wire mesh, or transparent polycarbonate. If visibility is provided through perforations or slots, the color of the material should be darker than the area observed to enhance visibility.

9. If the barrier guard has one or more interlocked sections, perform the following tests for each interlocked section.
   a. With the machine on and ready to be cycled in a production mode of operation, open an interlocked section of the barrier guard and attempt to cycle the machine. The machine should not cycle.
   b. An interlocked section must either (1) prevent opening until hazardous motion has stopped (with a locking interlock device), or (2) be located at the proper safety distance so that an individual cannot reach the hazard before hazardous motion has stopped when it is opened (with a nonlocking interlock device; see next page for the ANSI safety-distance equation).
      (1) **Locking:** With all interlocked sections of the barrier guard closed while the machine is cycling, attempt to open an interlocked section. The interlocked section should not open. A locking interlocked section must open only when the hazardous motion of the machine has stopped after a normal stop command.
      (2) **Nonlocking:** With all interlocked sections of the barrier guard closed while the machine is cycling, open an interlocked section. The machine should stop.
   c. Verify that reclosing of an open interlocked section does not, by itself, cause any hazardous motion of the machine. Restarting of the machine must require a deliberate action, such as reactuating the normal actuating means.

10. If any of these function tests fail, take corrective action before running production. If all tests pass, remove all keys from the selector switches before running production.

---

DANGER

Never place your hands or any part of your body in the hazard area while performing these tests.

Always perform these tests at every setup, operator, and shift change, as well as every time after maintenance is performed.

OSHA AND ANSI GUARD-OPENING SCALES

An OSHA or ANSI guard-opening scale can be used during the design, installation, and inspection of barrier guards to make sure they comply with the OSHA and ANSI guard-opening requirements. These stainless-steel guard-opening scales are available online at www.rockfordsystems.com.

SAFETY DISTANCE FOR NONLOCKING INTERLOCKED BARRIER GUARDS

The safety-distance equation for nonlocking interlocked barrier guards from Annex D of ANSI B11.19-2003, Performance Criteria for Safeguarding, is as follows:

\[ D_s = K(T_s + T_c + T_r + T_{spm}) \]

Where:

- \( D_s \) = safety distance that the interlocked section of the barrier guard must be located from the point-of-operation hazard
- \( K \) = maximum speed that an individual can approach the hazard (63 inches/second is commonly used)
- \( T_s \) = stopping time of the machine measured at the final control element
- \( T_c \) = reaction time of the control system
- \( T_r \) = reaction time of the interlock device and its interface
- \( T_{spm} \) = additional time allowed for the stopping-performance monitor to compensate for variations in normal stopping time (if applicable)
EXAMPLES OF SPECIAL PERIMETER AND POINT-OF-OPERATION BARRIER GUARDS

Guard on a Straightener

Guard on a Package Roller

Spring-Lift Guard on a Straight-Side Press With Adjustable Side Guards

Perimeter Guard Around a Transfer Line
Hand Feeding Tools is a comprehensive catalog that features a wide variety of pliers, tongs, positioners, and vacu-tongs.

These tools are used to keep hands out of the point of operation while feeding or removing parts from the machine.

All products in this catalog are intended and designed to meet the requirements of OSHA and ANSI safety standards.

Most of the tools are constructed of soft alloy materials, engineered to easily crush if caught between dies or parts of the machine. Vacuum lifters and magnetic tools are also featured in the catalog.

At Rockford Systems, we are experts at machine guarding because it has been our sole focus for over 50 years. We stand committed to the prevention of injuries and fatalities. Our mission is to enhance the long-term health and quality of life of workers in high-risk occupations, while improving the bottom line of the organizations we serve by increasing compliance, reducing risk, lowering costs and improving productivity.
A wide variety of hand-feeding tools are available. They are used to keep hands out of the point of operation while feeding or removing parts from the machine. Although they are not considered to be guards or devices by themselves, hand tools do offer additional protection. In addition to numerous pliers and tongs, hand tools are available with either suction cups or magnetic pick-ups. Most of the tools are constructed of soft alloy materials, engineered to easily crush if caught between dies or parts of the machine. Many of today’s hand tools are designed with ergonomics in mind. This provides the operator with maximum comfort and minimum fatigue.

**HAND FEEDING AND RETRIEVAL TOOLS (PLIERS, POSITIONERS, TONGS, AND VACU-TONGS)**

**Part No. CYF550**
Lightweight duckbill spring-opened pliers.
Jaw Length – 2-1/2"
Total Length – 7"
Weight – 2 oz

**Part No. CYF557**
Heavy-duty duckbill pliers.
Jaw Length – 3"
Total Length – 8-1/4"
Weight – 5-3/4 oz

**Part No. CYF565**
Similar to CYF554 with torsion spring.
Jaw Length – 3"
Total Length – 11-1/2"
Weight – 59/10 oz

**Part No. CYF551**
Pliers with long tapered jaws—ideal for small parts.
Jaw Length – 3"
Total Length – 7-1/2"
Weight – 2-1/4 oz

**Part No. CYF558**
Similar to CYF557 with thumb loop for operator comfort.
Jaw Length – 2-7/8"
Total Length – 8-5/8"
Weight – 5-1/2 oz

**Part No. CYF566**
Similar to CYF554 with vacuum cup.
Jaw Length – 3"
Total Length – 11"
Weight – 7 oz

**Part No. CYF552**
Pliers with a right-angle hook nose for gripping.
Jaw Length – 2-1/2"
Total Length – 7"
Weight – 2 oz

**Part No. CYF559**
Small, heavy-duty stubby pliers with good gripping capability.
Jaw Length – 1-1/2"
Total Length – 6-1/8"
Weight – 4 oz

**Part No. CYF567**
Heavy-duty straight-handled tongs for two-handed use.
Jaw Length – 3"
Total Length – 11-1/2"
Weight – 4 oz

**Part No. CYF553**
1-1/2" wide duckbill for rigid support.
Jaw Length – 3"
Total Length – 7-1/8"
Weight – 3-1/2 oz

**Part No. CYF560**
Medium-duty, spring-opened pliers with long nose.
Jaw Length – 4-1/2"
Total Length – 9-3/4"
Weight – 6 oz

**Part No. CYF568**
Medium-duty tongs with finger loops on both handles.
Jaw Length – 3"
Total Length – 10-1/2"
Weight – 6 oz

**Part No. CYF555**
Heavy-duty rugged plier.
Jaw Length – 2-3/4"
Total Length – 8-1/4"
Weight – 4 oz

**Part No. CYF562**
Ergonomic pliers with 45° bend.
Jaw Length – 3"
Total Length – 7"
Weight – 2-1/4 oz

**Part No. CYF569**
Popular ergonomic tongs with 30° bend and thumb loop.
Jaw Length – 2-7/8"
Total Length – 10"
Weight – 7 oz

**Part No. CYF556**
Similar to CYF551 with vacuum cup.
Jaw Length – 3"
Total Length – 7-1/2"
Weight – 4 oz

**Part No. CYF564**
Popular long-handled lightweight tongs.
Jaw Length – 3-1/8"
Total Length – 11-1/2"
Weight – 5 oz

**Part No. CYF570**
Ergonomic tong with 60° bend and two large loops. These tongs can be used in either direction.
Jaw Length – 2-1/2"
Total Length – 12"
Weight – 10 oz
HAND-FEEDING AND RETRIEVAL TOOLS (CONTINUED)

Part No. CYF571
Heavy-duty straight-handled tongs to handle parts up to 20 oz.
Jaw Length – 3”
Total Length – 10-5/8”
Weight – 6-1/2 oz

Part No. CYF572
Versatile heavy-duty tongs with thumb loop.
Jaw Length – 3”
Total Length – 10-1/2”
Weight – 7-1/2 oz

Part No. CYF573
Similar to CYF572 with vacuum cup.
Jaw Length – 3”
Total Length – 10-1/2”
Weight – 9-1/2 oz

Part No. CYF574
Heavy-duty tongs with finger loops on both handles.
Jaw Length – 3”
Total Length – 10-5/8”
Weight – 8 oz

Part No. CYF575
Rugged tongs for heavy parts up to 5 lb.
Jaw Length – 3”
Total Length – 12”
Weight – 10 oz

Part No. CYF576
Similar to CYF575 with adjustable set screw in jaw for extra gripping power or sheet pulling.
Jaw Length – 3”
Total Length – 12”
Weight – 11 oz

Part No. CYF577
Tong with short 1” jaw ruggedly designed for good gripping; gapped 3/16” for thick plate.
Total Length – 10”
Weight – 8 oz

Part No. CYF579
Tongs with thin tapered jaw. Extremely light-weight for their size.
Jaw Length – 2”
Total Length – 10-1/2”
Weight – 8 oz

Part No. CYF580
Popular right-angle-jaw tongs for handling flanged or cup-shaped workpieces.
Jaw Length – 5/8”
Total Length – 10-3/8”
Weight – 9 oz

Part No. CYF586
Extra long lightweight tongs.
Jaw Length – 3”
Total Length – 16-1/4”
Weight – 8-1/2 oz

Part No. CYF587
Needle–nose tongs designed to be held in the hand and closed by thumb pressure; ideal for small parts.
Jaw Depth – 2-7/8”
Total Length – 13-1/2”
Weight – 5-1/2 oz

Part No. CYF590
Designed to pick up 1-3/4” bushings.
Total Length – 12-1/8”
Weight – 6 oz

Part No. CYF591
Designed to pick up 1-3/4” bushings.
Total Length – 13-1/8”
Weight – 7 oz

Part No. CYF593
90° bend to remove parts from die.
Total Length – 14”
Weight – 2-1/2 oz

Part No. CYF595
Short–jaw tongs with long-handle protection.
Jaw Length – 2”
Total Length – 16”
Weight – 11 oz

Part No. CYF597
Tongs designed to hold 1/4” stock. Jaws are spaced 1/4” parallel.
Jaw Length – 3”
Total Length – 18”
Weight – 15 oz

Part No. CYF600
Lightweight tweezers.
Total Length – 6-1/2”
Weight – 11/10 oz

Part No. CYF601
Heavier tweezers.
Total Length – 9”
Weight – 13/5 oz
VACUUM LIFTERS

These vacuum lifters grip and hold oiled or dry sheet metal, glass, plastic, steel, plexiglass, polished stone, fiberglass, auto panels, or any other material with a smooth surface.

LITTLE-GRABBER LIFTER
These one-finger lifters are ideal for light objects or raising corners for better grip. Always handy and ready for use, yet leaves one hand free for other work. It has specially designed release tabs. Made from tough rubber compound.
Part No. KMK007 – 2-1/8” diameter (1” finger loop) – lifts 4 lbs
Part No. KMK056 – 2-5/8” diameter (1-1/4” finger loop for use with gloves) – lifts 6 lbs

KNUCKLE-SAVER LIFTER
This two-finger grip and larger cup provide extra lifting capacity. Its larger diameter makes this lifter ideal for greater loads. Breaks oil adhesions easily. It also has specially designed release tabs. Lifts about 10 pounds.
Part No. KMK008 – 3-1/4” diameter (1” finger loop)

SUPER-GRABBER LIFTER
This four-finger grip and larger cup provide extra lifting capacity. Its larger diameter makes this lifter ideal for greater loads. Breaks oil adhesions easily. It also has specially designed release tabs. Lifts about 12 pounds.
Part No. KMK055 – 4-3/4” diameter

MEDIUM-DUTY LIFTER
Sturdy construction and a fast-action metal release valve offer safe, quick handling of smooth surface materials. Full-hand grip for extra strength gives operator extra freedom of movement. Lifts about 10 pounds.
Part No. KMK009 – 3-1/4” diameter
Part No. KMK013 – Replacement cup only – 3-1/4” diameter

MEDIUM-DUTY GRABBER/LIFTER
This combination grabber and lifter combines the flexibility of a grabber with the holding strength of a lifter. Just lift the tipped edge to release the vacuum. Lifts about 15 pounds.
Part No. KMK040 – 3-1/4” diameter
HAND FEEDING TOOLS | 5

VACUUM LIFTERS (CONTINUED)

HEAVY-DUTY SHEET METAL LIFTER
These lifters have powerful suction to lift heavier loads. A handy trigger-valve release disengages the vacuum lifter instantly and safely. This saves wear and tear on gloves and hands. These lifters are generally used for loading, unloading, piling, and shifting sheet metal from trucks, stock, etc. The 3” cup lifts about 15 pounds; the 4” cup about 25 pounds; the 5” cup about 35 pounds.

Part No. KMK047 – single cup, 3” diameter
Part No. KMK043 – single cup, 4” diameter
Part No. KMK010 – single cup, 5” diameter

DOUBLE-CUP SHEET METAL LIFTER
These lifters have a convenient handle for one or two-handed lifting. Positive grip increases the operator’s working capacity. Dual trigger valves disengage the lifter from material. The 3” cups lift about 30 pounds; the 4” cups about 50 pounds; and the 5” cups about 75 pounds.

Part No. KMK054 – 2 cups, 3” diameter each
Part No. KMK044 – 2 cups, 4” diameter each
Part No. KMK011 – 2 cups, 5” diameter each

REPLACEMENT CUPS:
Part No. KMK057 – 3” diameter single cup
Part No. KMK031 – 4” diameter single cup
Part No. KMK014 – 5” diameter single cup

TWO-MAN VACUUM LIFTER
These lifters have extra capacity for extra safety. Ideal for moving heavy gauge metal, marble slab, heavy plate glass, and plastic sheets. The 4” cups lift about 50 pounds; the 5” cups about 75 pounds.

Part No. KMK041 – 2 cups, 4” diameter each
Part No. KMK042 – 2 cups, 5” diameter each

DOUBLE-CUP VERTI-LIFT
Powerful suction cups are used to lift and move loads from the floor without having to bend over. It has a handy trigger-valve release to disengage the vacuum lifter instantly and safely. These hand-operated vacuum lifters are used for repeated lifting and moving of non-porous materials on the ground level. The vertical handle is 32” and the total length is 37”. The 4” cups lift about 50 pounds; the 5” cups about 75 pounds.

Part No. KMK045 – 4” cup diameter
Part No. KMK031 – Replacement cup (4”)
Part No. KMK046 – 5” cup diameter
Part No. KMK014 – Replacement cup (5”)
VACUUM LIFTERS (CONTINUED)

These lifters can be used to place and remove material in and from the machine. These tools are not to be used as a point-of-operation safeguard, but can be used to help keep the operator’s hands out of the point of operation when loading parts.

These lifters have strengthened steel rods and oil-resistant flexible vacuum cups. They are ideal for handling plastic, metal, glass, and any other material that has a smooth, non-porous surface. There are three types of lifters to choose from. The single-cup lifter is available in three cup sizes. The double-cup lifter is available in one cup size. The straight-handle lifter has a handle attached to the top of the vacuum cup and provides the user with extra reach. All three lifters incorporate an instant release button. The 2-1/8” cup lifts about 3 pounds, the 3-1/4” cup lifts about 5 pounds, and the 4” cup lifts about 6 pounds. The double-cup lifters lift about 6 pounds.

REPLACEMENT CUPS:
Part No. KMK012 – 2-1/8” diameter
Part No. KMK013 – 3-1/4” diameter
Part No. KMK031 – 4” diameter

Part No. CYF604
Pick-up capacity up to 4 ounces with low profile.
Single magnet – 15" length

Part No. CYF605
Pick-up capacity up to 8 ounces with low profile.
Double magnet – 15" length
Press And Press Brake Control Systems is a comprehensive catalog that features a complete line of control systems for mechanical power presses & press brakes, and hydraulic power presses & press brakes. The catalog is divided into sections that offer control systems and components for:

- Full-Revolution-Clutch Presses
- Part-Revolution-Clutch Presses and Press Brakes
- Hydraulic Presses and Press Brakes
- Press Automation Control

The catalog goes into detail about the features of the systems, and describes the different options available to update or replace existing control systems. This catalog also includes spring-loaded turnover bars, palm button assemblies, danger signs, and a section with helpful references.

All products in this catalog are intended and designed to meet the requirements of OSHA and ANSI safety standards.

At Rockford Systems, we are experts at machine guarding because it has been our sole focus for over 50 years. We stand committed to the prevention of injuries and fatalities. Our mission is to enhance the long-term health and quality of life of workers in high-risk occupations, while improving the bottom line of the organizations we serve by increasing compliance, reducing risk, lowering costs and improving productivity.

2. NEC (National Electrical Code) Handbook

These can be purchased by contacting:

National Fire Protection Association
1 Batterymarc Park
Quincy, MA 02169
(617) 770-3000 • www.nfpa.org

3. NEMA (National Electrical Manufacturers Association)

1300 North 17th Street, Suite 1752
Rosslyn, VA 22209
(703) 841-3200 • www.nema.org

For additional safety information and assistance in devising, implementing or revising your safety program, please contact the machine manufacturer, your state and local safety councils, insurance carriers, national trade associations, and your state’s occupational safety and health administration.
MECHANICAL POWER PRESS CONTROL SYSTEMS

Each mechanical power press must be looked at as an individual system. This system consists of, but is not limited to, the frame, all mechanical parts, clutch and brake assemblies, electrical or electronic systems, hydraulic systems, pneumatic systems, tooling or dies (present and future), tool or die setup, safeguarding, material handling, maintenance requirements, size or configuration of workpiece, and most importantly, production requirements.

OSHA STANDARDS
The controls and safeguarding systems offered in this section of the catalog will help the user of mechanical power presses (punch presses) meet or exceed OSHA 29 CFR 1910.212, 1910.217, 1910.219, 1910.147 and ANSI B11.1 safety standards as we interpret them. OSHA’s Code of Federal Regulations can be purchased by contacting:

U.S. Government Printing Office
P.O. Box 371954
Pittsburgh, PA 15250-7954
(202) 512-1800
http://bookstore.gpo.gov

ANSI STANDARDS
There are several references available on press safety; however, most industries use the ANSI (American National Standards Institute) B11.1 standard for the best safety practice on power presses. This standard can be purchased by contacting:

ANSI
American National Standards Institute, Inc.
25 West 43rd Street, 4th Floor
New York, New York 10036
(212) 642-4900
www.ansi.org

TYPES OF CLUTCHES ON PRESSES
Most power presses have one of two types of clutches:

1. Full Revolution (sometimes referred to as a mechanical clutch)
2. Part Revolution, classified in two categories:
   — Air Clutch
   — Mechanical-Friction Clutch

CONDITION OF THE PRESS
The equipment offered in this catalog can neither cure nor overcome a malfunctioning machine or prevent a mechanical defect or failure of a component part thereof, nor prevent a repeat or unintended stroke (cycle) resulting from a mechanical malfunction, defect or failure of the machine itself.

For example, on mechanical power presses, a brake monitoring system can only detect a gradual deterioration of the brake on the press, not a catastrophic mechanical failure in the clutch/brake mechanism.

It is essential that the machine be thoroughly inspected and that all mechanical, electrical, pneumatic, and hydraulic components and systems, including all collateral equipment, be in first-class operating condition before any equipment is installed. A maintenance and inspection program must be established and implemented to keep machines in your plant in first-class condition. This program must include regular periodic inspections of each machine to ensure that, among other things, (i) the clutch and brake mechanism, mechanical linkages, and air counterbalances are operating and used properly; (ii) there is no dirt or water in the air lines; and (iii) the machine is operating at its proper speed (RPM or SPM). Any part of the machine that is worn, damaged, or not operating correctly must immediately be replaced or repaired before the machine is used.
SAFETY CONSIDERATIONS ON PRESSES

Referencing OSHA 29 CFR 1910.217(d)(1), it states: “The employer shall (i) use dies and operating methods designed to control or eliminate hazards to operating personnel, and (ii) furnish and enforce the use of hand tools for freeing and removing stuck work or scrap pieces from the die, so that no employee need reach into the point of operation for such purposes.”

BASIC REQUIREMENTS

When updating presses to comply with the indicated safety standards, there are five basic requirements that must always be considered. They are:
1. Safeguarding (Refer to Catalogs Safeguarding Devices & EX-AL)
2. Controls (pp. 7-46)
3. Disconnects (pp. 10, 11, 23, 27, 38, 45, and Safety Shields catalog)
4. Starters (pp. 10, 11, 23, 27, 38, 45, and Safety Shields catalog)
5. Covers (Refer to www.rockfordsystems.com for mechanical motion covers)

This introduction and subsequent pages in this catalog will provide information on safety requirements in the above areas.

SAFEGUARDING

The following are OSHA-recognized methods for safeguarding the point of operation on mechanical power presses:

PART REVOLUTION
1. Barrier Guard (Refer to EX-AL catalog)
2. Two-Hand Control (pp. 18-46)
3. Presence-Sensing Device (Refer to Safeguarding Devices catalog)
4. Pullback (Not offered by Rockford Systems)
5. Restraint (Refer to Safeguarding Devices catalog)
6. Type A or B Gate (Refer to Safeguarding Devices catalog)

FULL REVOLUTION
1. Barrier Guard (Refer to EX-AL catalog)
2. Two-Hand Trip (pp. 7-17)
3. Pullback (Not offered by Rockford Systems)
4. Restraint (Refer to Safeguarding Devices catalog)
5. Type A Gate (Refer to Safeguarding Devices catalog)

When safeguarding, please keep in mind that the sides and back of the point of operation must also be safeguarded to protect the operator and other employees.

OSHA’s safety distance formula for two-hand control, two-hand trip, and presence-sensing devices can be found on pages 107-108 of this catalog. Refer to our Safeguarding Devices catalog for ANSI’s safety distance formulas.

CONTROLS

Controls are furnished according to the type of press: full revolution or part revolution. Please see later pages detailing these requirements for further explanation.

ELECTRICAL AND LOCKOUT REQUIREMENTS

A press system requires a proper disconnect switch, motor starter, transformer (for reducing the voltage to 120 V or less), and an air lockout valve.

When applying any of the standard control boxes offered in this catalog, a 120-V coil must exist or be changed in the present magnetic starter on the press. If a press has a manual starter, it must be replaced with a magnetic-type starter. The standard and custom control boxes are furnished with a multi-tap transformer for various primary voltages.

COVERS

Mechanical power-transmission apparatus include components on a machine or auxiliary equipment including shafts, crankshafts, splines, pulleys, sprockets, rolls, flywheels, gears, and couplings. These components can create hazards to personnel who work on or around the machines. They must be covered in accordance with OSHA 29 CFR 1910.219 and ANSI B15.1. All apparatuses that create a hazard must be guarded (covered) if at or below a seven-foot level from the floor or platform. This is usually done by the user, either by modifying existing guards, by contacting a local sheet-metal fabricator to make a new cover, or refer to our Web site at www.rockfordsystems.com for mechanical motion covers.

AUXILIARY SAFEGUARDING

Auxiliary safeguarding is used for additional protection from injuries for all personnel in the machine area. It is used in conjunction with primary safeguarding devices. Auxiliary safeguarding also involves the guarding of other components or hazardous openings on machines. One of these hazards is created by auxiliary feeding equipment used with some power presses. Auxiliary equipment includes various types of feeds, shuttles, magazines, stackers, indexing tables, straighteners, reels, cradles, recoilers, scrap choppers, iron hands, robots, etc.

Auxiliary safeguards include such items as point-of-operation side barriers when light curtains are used, pressure-sensitive safety mats, workpiece tables, or horizontal light curtains. An additional set of light curtains can be used horizontally to prevent an operator or other persons from standing between the vertical plane of light and the point-of-operation hazard. Please remember that light curtains can only be used on part-revolution presses.
MECHANICAL POWER PRESS CONTROL SYSTEMS

STRAIGHT-SIDE PRESS ARRANGED FOR AUTOMATIC FEEDING

The two most commonly used safeguards for presses equipped with automatic feeds are guards and presence-sensing devices (light curtains). These safeguards are detailed in our machine safeguarding devices catalog—Safeguarding Devices catalog. When considering either of these safeguards, arrange them to protect the point of operation as well as the feed. This may require the guard to extend to the right or left of the bolster on OBI presses. If a scrap chopper is furnished, the guarding must also be extended to safeguard it. If a feed and scrap chopper are on the sides of straight-side presses, the feed, scrap chopper, and window openings also need to be safeguarded.

When protecting operators and other employees in the press area from hazards created by straighteners, pay-off reels, cradles, iron hands, robots, etc., the perimeter or work envelope of this auxiliary equipment can be safeguarded as illustrated above. This is usually accomplished with guards, presence-sensing devices, safety mats, or a combination of these safeguards.

When protecting these areas, keep in mind that access may be required for changing coils and removing scrap, blanks, etc.

Danger signs, used for warning, can be mounted on the machine in a position that is readily visible to the operator, setup person, or other personnel. Hand tools are another auxiliary safeguard often used when feeding and retrieving small workpieces or removing scrap from the die area. Hand tools by themselves are not a point-of-operation safeguarding device.

When using a light curtain, the mounting brackets for the transmitter and receiver may have to be modified to include safeguarding of the feed. The light curtain’s plane of light commonly protects only the front of the press. Additional guards or mirrors that reflect the light curtain’s plane of light are needed to safeguard the sides and back of the machine.

When safeguarding presses equipped with shuttles, magazines, stackers, indexing tables, etc., the previously discussed safeguards can be used. This assumes that the press is operating in either the continuous or automatic single-stroke mode of operation. If the press is single-stroked by overt operator action, other safeguards such as two-hand control, pullback devices, restraints, or gate devices could be used. The back and sides of the point of operation must always be protected as well.

AIR AND HYDRAULIC PRESSES

Two-hand-control packages for air presses and other air-operated machines and devices can be reviewed in our machine safeguarding devices catalog—Safeguarding Devices catalog.

Controls for hydraulic presses are also available. Two-hand control is usually furnished along with other point-of-operation safeguarding. Please see pages 51-57 for further details.
**FULL-REVOLUTION-CLUTCH PRESS CONTROL SYSTEMS**

**OSHA 29 CFR 1910.211 DEFINITION**

“Full-Revolution Clutch” means a type of clutch that, when tripped, cannot be disengaged until the crankshaft has completed a full revolution and the press slide a full stroke.

All of the full-revolution-clutch press control systems are furnished with two-hand trip that can be used as a point-of-operation safeguard—refer to pages 104, 107, 108, or Safeguarding Devices catalog for detailed information on the safety requirements for two-hand trip. Various other types of guards or devices may be more desirable, such as barrier guards, pullbacks, restraints, or type A gates. For these guards and devices, please refer to our barrier and perimeter guarding systems catalog—EX-AL catalog, and our machine safeguarding devices catalog—Safeguarding Devices catalog.

**FULL-REVOLUTION CLUTCH**

The full-revolution-clutch press was designed to make one full machine cycle (stroke) or crankshaft revolution after each engagement of the mechanical pin, collar, or rolling key.

On full-revolution presses, the main concern of the clutch control is that it has single-stroke capability if the press is single-stroked. This means that if the actuating means, such as the palm buttons or foot switch, is held operated through an entire stroke, the press will stop at its normal TDC (top dead center) stopping position, barring any mechanical catastrophic failures.

This section includes trip-control systems which provide single-stroke capability, a requirement of both OSHA and ANSI. These systems also provide two-hand trip which can be used as a point-of-operation safeguarding device when mounted at the proper safety distance.

Full-revolution single-stroke trip-control systems provide other modes of operation, such as continuous-on-demand, foot-maintained continuous, automatic single stroke, and two-hand motor jog for die setup and maintenance requirements.

Two-hand motor jog is used when the die or tooling is being set up in the press, with the flywheel at rest. It allows the designated setup person to engage the clutch and jog the motor in order to bring the slide down to BDC (bottom dead center). Usually when the slide is in this position of crankshaft rotation (BDC), a die is removed and another is set up.

Three reasons to install a trip-control system on full-revolution-clutch presses that may already have single-stroke mechanisms are: 1) the two-hand motor jog feature, 2) the ease of operating a foot switch versus a mechanical foot treadle, and 3) two-hand trip eliminates the foot pedal/treadle operation.

In addition to providing single-stroke capability with a trip-control system, all full-revolution presses require a safeguarding system. The following are OSHA-recognized methods for safeguarding the point of operation on full-revolution-clutch mechanical power presses:

1. Barrier Guard (Refer to EX-AL catalog)
2. Two-Hand Trip (Refer to this section)
3. Pullback (Not offered by Rockford Systems)
4. Restraint (Refer to Safeguarding Devices catalog)
5. Type A Gate (Refer to Safeguarding Devices catalog)
FULL-REVOLUTION-CLUTCH PRESS CONTROL SYSTEMS

When safeguarding, please keep in mind that the sides and back of the point of operation must also be safeguarded to protect the operator and other employees.

OSHA’s safety distance formula for two-hand trip can be found on page 108 of this catalog. Refer to the graph below for a guideline in determining two-hand trip safety distance.

Other safety considerations on a full-revolution-clutch press are the main power disconnect switch, magnetic motor starter, and covers for the flywheel, gears, etc.

CONTROL SYSTEMS

A full-revolution control system consists of:

1. A control box (pp. 9-11)
2a. Individual components (pp. 12-14)
    OR
2b. Component packages (pp. 15-16)
3. An air cylinder (p. 17)
4. An air lockout valve (p. 14 or 33)

Components in the control system can include a palm button assembly, a foot switch, a monitored dual-solenoid air valve, a filter-regulator-lubricator assembly, an air pressure switch, an air lockout valve, a cam and mounting strap assembly, and a limit switch assembly. The components for these systems will vary depending on the actuating means and the modes of operation that are chosen.

SELECTING A CONTROL SYSTEM

1. To order a control system, determine which control box is required. Choose a control from pages 9-10.
2. Determine which components meet your mode-of-operation requirements. This depends on your production requirements. To simplify this step, component packages are available. See pages 15-16.
3. Select an appropriate air cylinder. Air cylinders are available in a variety of sizes and configurations to fit the specific machine application. See page 17.
4. Add an air lockout valve, if required. See page 14 or 33.

TWO-HAND TRIP SAFETY DISTANCE CHART

To establish the proper safety distance for two-hand trip on full-revolution-clutch presses, determine the speed of the press in SPM (strokes per minute) when running in the continuous mode and the number of engagement points in the clutch mechanism. Then determine the safety distance from the following chart.
The electro-pneumatic trip-control system is designed for use on full-revolution-clutch mechanical power presses. It is designed and built to comply with OSHA 29 CFR 1910.217 and ANSI B11.1 and B11.19. This control updates full-revolution-clutch presses that do not presently have single-stroke capability. It can also be a replacement for existing trip-control systems.

This control is an economic, full-featured microprocessor-based press trip control. The system uses a microprocessor to cross-check and monitor the control relays. In the event of a control malfunction, further operation is prevented. See page 111 for details on control reliability.

The multi-tap transformer has a 115-, 208-, 230-, 460-, and 575-V primary, 115V secondary, and 100-VA rating. This control must be wired in to a motor starter that has a 115V operating coil. This provides primary power to the clutch control and to the control box for the two-hand motor jog mode of operation.

The standard control box is housed in a 16” x 10” x 6” NEMA 12 enclosure. The ground indicator light and operator controls are located on the front of the enclosure door. The motor controls are usually located in a remote station.
CUSTOM FULL-REVOLUTION CONTROL

Full-revolution-clutch custom control boxes and packages are available to fit your particular press room needs. A custom control box contains the standard control module and components as described on pages 9-10 plus the following:

- main power disconnect switch
- main drive motor starter
- ram-adjust motor starter (if required)

These boxes are furnished with an IEC through-the-door main power fused disconnect switch and an IEC magnetic motor starter (with push buttons). A reversing ram-adjust motor starter with selector and push buttons may also be included. They are prewired and built into a larger NEMA 12 enclosure.

Operator controls are located on the front of the enclosure door. The motor controls can be located in a remote station or on the enclosure door.

NEMA-style disconnect switches and motor starters, and brand-name components specified by our customers are also available. To ensure the starter(s) and disconnect are sized properly, please check horsepower for the main drive motor and slide adjust motor (if furnished) on the press, as well as full-load amps, and primary voltage to the press.

After obtaining this information, please go to the chart on page 11 to determine the proper custom control box part number. Follow directions 1-7 to determine the correct part number.

STANDARD MODES OF OPERATION

- Two-hand motor jog
- Two-hand single stroke
- Two-hand “walk-away” continuous*
- Foot single stroke
- Foot-maintained continuous*
- Automatic single stroke*
- Continuous-on-demand*

*Requires a remote prior-action station.

FEATURES

- Single-stroke capability operation
- Two-hand antirepeat
- Two-hand trip as a point-of-operation safeguard
- Two-hand anti-tie down and concurrent operation
- Controls all types of full-revolution clutches
- Redundant-logic system microprocessor
- Provisions for electrically interlocking safety devices
- Isolated microprocessor logic power supply
- Redundantly monitored solid-state relay/captive-contact relay output for trip solenoid(s)
- Saddle-clamp circuit board terminal strips
- Supports redundant, self-checking solenoid valves
- Fused SSR (solid-state relay) outputs
- Type A gate interface
SELECTING A FULL-REVOLUTION-CLUTCH PRESS CONTROL

To determine the 8-digit configured part number for the full-revolution control required, follow directions 1-7 below and use the information in the PART NUMBERING SYSTEM CHART below.

1. The first 2 digits for all full-revolution controls are FP.
2. The 3rd digit determines the modes of operation required.
3. The 4th digit determines the size of the disconnect switch, if provided, in the control enclosure. Zero (0) indicates no disconnect switch provided.
4. The 5th and 6th digits determine the size and type of nonreversing motor starter, if provided, in the control enclosure. Zeros (00) in both positions indicate no motor starter provided.
5. The 7th digit determines the location of the operator controls.
6. The 8th digit will indicate the type of modifier provided: i.e., main drive motor control operators remote.

SAMPLE

The sample shown, FPF112-F5, indicates that the custom full-revolution-clutch control box will provide two-hand single stroke, two-hand motor jog, two-hand continuous, foot single stroke, and foot-maintained continuous modes of operation. There will be an IEC 30A disconnect switch and an IEC 18-A nonreversing main drive motor starter without ram adjust. All operator controls will be on the door of the enclosure with the exception of the main drive motor operators which will be located remote.

**REQUIRED if two-hand continuous, foot-maintained continuous, automatic single stroke, and/or continuous-on-demand modes of operation are used.**

**See page 50 for remote motor control operator stations or Safety Shields catalog.**

FULL-REVOLUTION-CLUTCH PRESS CONTROL SYSTEMS
INDIVIDUAL COMPONENTS

The components for these full-revolution control systems will vary depending on the actuating means and the modes of operation that are chosen. To simplify this, component packages are available. Please see pages 15-16 for part numbers and descriptions of the component packages. The control system can include the following components.

1/4” MONITORED DUAL-SOLENOID AIR VALVE
Part No. RCD140*

This three-way, ¼” monitored dual-solenoid air valve is ideal for operating air cylinders on full-revolution presses. This dual valve is pneumatically checked. To assist in installation, this valve has a common electrical connector for both solenoids with a 12-foot cord.

1/4” FILTER-REGULATOR-LUBRICATOR ASSEMBLY (FRL)
Part No. RCL043*

This assembly is needed to meet the OSHA and ANSI requirements. This FRL assembly filters, regulates, and lubricates the air going through it. This filtered and lubricated air then goes to the solenoid air valve assembly and air cylinder. The regulator should be adjusted so just enough air pressure reaches the air cylinder to operate the clutch. This assembly includes a gauge, coupling, and steel mounting bracket.

AIR PRESSURE SWITCH
Part No. CTD062*

This air pressure switch is needed to meet the OSHA and ANSI requirements. The air pressure switch monitors low pressure to either the air cylinder air supply or ram counterbalance systems. The pressure switch must be set so if the air pressure operating the components is not adequate, or if the air pressure suddenly drops, the press becomes inoperable.

CAM AND STRAP ASSEMBLY
Part No. CML002*

A cast-aluminum cam and adjustable stainless-steel strap are furnished so the cam can easily be mounted on the crankshaft extension. The strap is adjustable up to 6” diameter and is locked in place by tightening the screw.

Note: Drilling or tapping the end of the crankshaft is not required. All that is required to install it is to slip the cam and strap assembly on the crankshaft, line it up with the top-of-stroke limit switch assembly, and tighten. See next page.

*Included in a component package on pages 15-16.
INDIVIDUAL COMPONENTS (CONTINUED)

TOP-OF-STROKE LIMIT SWITCH ASSEMBLY
Part No. CMK103*
This top-of-stroke limit switch assembly with a 25’ cord is actuated by
the cam mounted on the crankshaft and is specifically selected for this
application. The top-of-stroke limit switch provides dual force-guided
contacts to provide the signals when the machine is in the single
stroke mode of operation. If the machine does not stop at top dead
center, or if the switch assembly malfunctions, becomes improperly
adjusted, or the mounting becomes jarred loose, the control will not
allow a successive stroke.

A mounting bracket for the limit switch assembly is not furnished. To
purchase the EX-AL™ mounting bracket material shown in the photo,
please contact Rockford Systems at 1-800-922-7533.

PALM BUTTON ASSEMBLIES
To meet OSHA and ANSI safety requirements, the two run/jog buttons
must be protected against accidental operation (with ring guards) and
separated to require the use of both hands to operate them. They also
must be mounted at the proper safety distance, if they will be used as a
safeguard. The electrical contact arrangement of the following buttons
is 1 NO and 1 NC.

Part No. CTL502*
This palm button assembly consists of two black run/ inch buttons
(with ring guards), a red emergency-stop button, and a yellow top-stop
button. Mounting boxes are furnished with each button. The red and
yellow palm buttons each have 1 NO and 1 NC arrangement. The red
button is on a yellow-covered mounting box and is equipped with a
mechanical latch to meet NFPA 79.

Part No. CTL507*
This palm button assembly consists of two black run/ inch buttons (with
ring guards), and a red emergency-stop button (for press applications
without the continuous mode of operation). Mounting boxes are
furnished with each button. The red palm button is on a yellow-covered
mounting box and has 1 NO and 1 NC arrangement plus a mechanical
latch to meet NFPA 79.

See page 87-88 for other palm button assembly options.

FOOT SWITCH
Part No. CTD011* & CTD088
To meet OSHA and ANSI safety requirements, a foot switch must be
protected from unintentional operation. The foot switch pedal (on the
inside) is protected on the top and both sides by the cast cover and the
front is protected by the hinged flap. This flap must be raised by the
operator’s toe before allowing the foot to enter the switch. When the
hinged flap is in the down position, it is also mechanically interlocked
with the operating pedal. The contact arrangement is 1 NO and 1 NC.

*Included in a component package on page 15-16.
INDIVIDUAL COMPONENTS (CONTINUED)

PRIOR-ACTION STATION FOR CONTINUOUS
Part No. LLD400*

This remote prior-action station is required for the continuous or maintained-continuous mode of operation. If a component package is not supplied with the control box, this station must be ordered. The button is furnished separately in an enclosure so it can be mounted in a convenient location on the front of the press. The NEMA 12 enclosure size is 3½” x 4½” x 3½”.

PRIOR-ACTION STATION FOR AUTOMATIC SINGLE STROKE OR CONTINUOUS-ON-DEMAND
Part No. LLD406*

This prior-action station is required for the automatic single-stroke or the continuous-on-demand mode of operation. These modes of operation are only available with the FPA control box. This prior-action push-button station can also be used for either the two-hand “walk-away” or the foot-maintained-continuous mode of operation.

This station is furnished with a three-position keyed selector switch for automatic single/off/continuous-on-demand. It also has an illuminated prior-action push button. If a component package is not supplied with the control box, this station must be ordered separately. It is furnished in its own enclosure so it can be mounted in a convenient location on the front of the press. The NEMA 12 enclosure size is 5¾” x 4” x 3¾”.

BAR/RUN STATION
Part No. LLD404

This remote bar/run station can be used in conjunction with a manual turnover bar when setting dies in the press. The flywheel must have holes in the periphery for insertion of a spring-loaded turnover bar** (or the flywheel can be manually turned when the flywheel cover is removed). The remote station includes a three-position selector switch for bar/off/run, and one push button used for energizing the dual-solenoid air valve to engage the clutch and release the brake. The flywheel must be at rest (static) when engaging the clutch. After the clutch is engaged, the die setup person can manually turn the flywheel with a spring-loaded turnover bar (see page 86). The enclosure size is 5¼” x 3” x 3¼”.

1⁄4” AIR LOCKOUT VALVE
Part No. RCD071

This three-way valve is operated with the manual movement of a slide that opens and closes the valve. This valve shuts off air at the press and then bleeds off downstream air. This lockout is not included in the component packages listed on pages 15-16 and must be ordered separately. Different styles and valve sizes are available; please see page 35.

Pneumatic System on Full-Revolution-Clutch Power Press

Air Supply → Air Lockout Valve → Filter-Regulator-Lubricator → Solenoid Air Valve → Air Cylinder → Air Pressure Switch

*Included in a component package on pages 15-16.
**For a spring-loaded turnover bar, see page 86.
SELECTING A COMPONENT PACKAGE
Determine which modes of operation and actuating means you require. Use the following charts to select the component package you require.

MODES OF OPERATION AVAILABLE:
H—Two-Hand Single Stroke  
F—Foot Single Stroke  
M—Foot-Maintained Continuous  
J—Two-Hand Motor Jog  
C—Two-Hand “Walk-Away” Continuous  
A—Automatic Single Stroke  
A—Continuous-On-Demand

COMPONENT PACKAGES USED WITH FPH, FPF, OR FPG CONTROL BOXES

COMPONENT PACKAGES USED WITH FPA CONTROL BOXES

PACKAGE NO. FNH011  HJ
TWO-HAND SINGLE STROKE AND METER JOG

**Note:** For control box selection, see pages 9-11. For air cylinder selection, see page 17, and for lockout valve, see page 14.
An air cylinder must be ordered separately using a specific part number. It is required to complete the control system. The air cylinder is attached to the clutch operating rod in order to trip the press. Normally, single-acting, pull-type/spring-return air cylinders are required. The return spring on the cylinder rod is compression type and is designed to prevent interleaving to meet OSHA and ANSI standards. A clevis mounting arrangement is furnished to attach the cylinder to the press frame. A rod, yoke, and pin assembly for ease in connecting to the existing clutch operating rod is standard on all cylinders. Push-type/spring-return and longer or shorter stroke air cylinders are also available. To determine the proper size or type of air cylinder, check the linkage where the cylinder will be inserted. Please consult the factory for any special requirements.

SAFEGUARDED PART-REVOLUTION-CLUTCH PRESS

A Part-Revolution-Clutch Press With Clutch/Brake Control and a Presence-Sensing Device and Two-Hand Control as Safeguards
**SSC1500 PRESS CONTROL**

**PART-REVOLUTION CLUTCH**

The majority of part-revolution presses have an air-applied clutch and an air-released brake. They are designed to trap air in a chamber or tube. When compressed air is put into these chambers or tubes, the clutch is engaged and the brake is released. The press then starts a cycle. To stop the press, the opposite takes place. A part-revolution-clutch press can be engaged and disengaged at any position of crankshaft rotation or revolution.

Occasionally older mechanical-friction-clutch presses are found in plants and are still being used. Sometimes press brakes with mechanical-friction clutches are used as power presses. These press brakes and the older mechanical-friction-clutch presses can be updated by adding a properly sized air cylinder to the part-revolution control packages that are offered. See pages 75-76 for these air cylinders.

Due to the many detailed OSHA requirements on part-revolution-clutch presses, most existing clutch/brake control systems on presses do not meet safety standards and regulations if they were installed prior to 1971. Most of these presses do not have control reliability and brake monitoring.

The part-revolution-clutch/brake control-reliable systems in this catalog are designed to stop the press and render it inoperable if there is a single component failure in the control system. This is done by minimizing the use of static-condition components and using critical, redundant components that are checked. Microprocessors or relays of special construction are used in this type of reliable control system (see page 99). The clutch/brake control systems offered here are furnished with a built-in, two-hand control safeguarding device.

In addition to the clutch/brake control meeting the requirements of the safety standards, all part-revolution presses require a safeguarding device or guard (barrier) to protect people that operate, set up, and maintain these machines.

The following are OSHA- and ANSI-recognized methods for safeguarding the point of operation on part-revolution-clutch mechanical power presses:

1. Barrier guard (EX-AL catalog)
2. Presence-sensing device (Safeguarding Devices catalog)
3. Two-hand control (Refer to this section)
4. Pullback (Not offered by Rockford Systems)
5. Restraint (Safeguarding Devices catalog)
6. Type A or B gate (Safeguarding Devices catalog)

When safeguarding, please keep in mind that the sides and back of the point of operation must also be safeguarded to protect the operator and other employees.

OSHA’s safety distance formula for two-hand control, two-hand trip, and presence-sensing devices can be found on pages 107-108 of this catalog. Refer to our Safeguarding Devices catalog for ANSI’s safety distance formulas.

Other considerations on a part-revolution-clutch press are the main power disconnect switch, magnetic motor starter, covers for the flywheel, gears, etc.

**PART-REVOLUTION CONTROL SYSTEMS**

A part-revolution control system consists of:

1. A control box (pp. 19-27)
2a. Individual components (pp. 28-35)

OR

2b. Component packages (pp. 34-35)

We offer a variety of control boxes that can be furnished to meet your specific requirements. The SSC1500 solid-state control box version is available as follows:

1. Standard clutch/brake control
2. Custom clutch/brake control which includes a fused disconnect switch and magnetic motor starter
3. Special clutch/brake control
4. Remote operator style

**SELECTING A CONTROL SYSTEM**

1. To order a complete control system which includes control reliability and brake monitoring, determine which style control box is required. A standard control box includes the clutch/brake control and transformer.
SELECTING A CONTROL SYSTEM (CONTINUED)

The clutch/brake control can also be furnished in a plain-door enclosure, as a subpanel, or as a module kit. The plain-door control requires a remote operator station. Subpanels and module kits are furnished without the enclosure; module kits include the primary internal components of the control only. Subpanels and module kits must be installed into an existing enclosure by qualified personnel. The subpanel or module kit also requires a remote operator station or a keypad/display kit.

A custom control box includes a main power disconnect switch and magnetic motor starter in the same enclosure as the clutch/brake control. A reversing ram-adjust motor starter may also be included.

Special control boxes can include either a standard or custom clutch/brake control that requires modification for any special requirements. This can be an interface of auxiliary equipment, such as a lube system, a light curtain interface for a non-Rockford light curtain, or components specified by the end user, such as NEMA starters and disconnects.

Remote operator-style control boxes include the clutch/brake control and are designed to be mounted close to the operator. A control transformer must be supplied separately or the existing transformer must be reused.

2. The CMS115 resolver/pulser assembly is always required with any of the SSC1500 controls.

3. After determining the style of control box, determine the location of the operator controls, indicator lights, and the keypad/display. Please remember these components should be installed in a convenient location for the operator. These components can be supplied as follows:
   1. On the front of the enclosure
   2. In a remote operator station
   3. In a control bar
   4. In a console
   5. Loose for installation in an existing box

4. Determine which other components are required (dual-solenoid air valve, air pressure switches, etc.). If existing components comply with the safety requirements, they can be reused with the control box that is furnished. If the components do not comply, complete component packages are available. Please see pages 34-35.
**SSC1500 STANDARD PRESS CONTROL**

The SSC1500 control is designed for use on part-revolution-clutch power presses. It is designed and built to comply with OSHA 29 CFR 1910.217, and ANSI B11.1 and B11.19. These controls can update or replace existing relay-based control systems, found in user’s plants; they can also be furnished for new or rebuilt presses.

This control includes control reliability (see page 111), motion detection with a time-based brake monitor, light curtain interface, and diagnostics (eight user-programmable inputs). It also includes batch and stroke counters with preset, a total counter, and a hard-wired emergency-stop master control relay.

The SSC1500 is an economic, full-featured, dual-microprocessor-based control system. The system uses redundant inputs from devices such as palm buttons, foot switches, and a light curtain(s). The system output to the dual-solenoid air valve is provided by two (2) safety relays with force-guided contacts. These output relays are independently controlled and cross-checked by the microprocessors. This allows control-reliable operation of the outputs in the event of a single control component failure. Each microprocessor also has its own logic power supply. This decreases the possibility of simultaneous control failure because of a fault within the power supply system. Timing and motion detection of the crankshaft is accomplished by the resolver/pulser assembly.

The standard control box is a 20” x 20” x 8” NEMA 12 enclosure with the operator controls and keypad/display mounted in the door, as illustrated above.

If a starter or disconnect is required in the same enclosure as the standard SSC1500 control, see page 23, SSC1500 custom controls. If a separate starter or disconnect, or combination starter disconnect is required, refer to our Safety Shields catalog.
SSC1500 STANDARD PRESS CONTROL (CONTINUED)

STANDARD MODES OF OPERATION
• Off
• Two-hand inch (regular, timed, or top-stop)
• Two-hand single stroke
• Foot single stroke
• Two-hand “walk-away” continuous
• Continuous-on-demand
• Automatic single stroke
• Two-hand-maintained continuous
• Foot-maintained continuous
• One-hand or foot trip single stroke
  (use with light curtain or interlocked guard only)

PROGRAMMING
The SSC1500 press control has eight (8) user-programmable inputs (6 static-type and 2 static- or cyclic-type inputs) that can be programmed for equipment monitoring or other user-defined functions. All inputs are 24-V DC selectable current-sinking or sourcing inputs.

There are three parameters that can be programmed for the six static-type inputs, and five parameters that can be programmed for the two static- or cyclic-type inputs. The three parameters are input logic, stop type, and fault message; the five parameters are input logic, stop type, fault message, open angle, and close angle. They can be assigned to each input from the list below. When a fault condition is detected, the machine will top stop or emergency stop, and the assigned message will be displayed. This feature helps when troubleshooting common fault conditions.

FAULT MESSAGE LIST:
Clutch/Brake Air Fault
Counterbalance Air Fault
Dual Solenoid Fault
Clutch Valve Fault*
Brake Valve Fault*
Lube Fault
High Lube Pressure
Low Lube Pressure
Low Lube Level
Main Motor Overload
Ram-Adjust Motor Overload
Lube Motor Overload
 Auxiliary Motor Overload
Guard Interlock Open
Front Guard Open
Rear Guard Open

Left Side Guard Open
Right Side Guard Open
Feeder Fault
Load Monitor Fault
Safety Block Interlock
Shut Height Fault
Variable Speed Drive Fault
Die Protection Fault**
Short Feed Fault**
Part Ejection Fault**
Stock Buckle Fault**
End of Stock Fault**
Pilot Pin Fault**
Part Input #1**
Part Input #2**
Part Input #3**

*Only used on machines that have a split clutch and brake, and two dual valves have been furnished.
**Messages typically used for die protection.

FEATURES
• Meets and exceeds OSHA 29 CFR 1910.217 and ANSI B11.1 and B11.19
• Provides two-hand control safeguarding device
• Redundant/cross-checking microprocessors
• Redundant microprocessor logic power supplies
• Redundant solenoid relays
• 4-line x 20-character LCD (liquid crystal display) with 20-key operator interface
• Wide range of input power supply — 85-to 135-VAC
• Absolute resolver/pulser with sync sensor for timing and motion detection
• Time-based brake monitor with programmable warning and fault set points
• Stop-time measurement test
• 6 user-programmable 24-V DC static diagnostic inputs
• Part-in-place 24-V DC input
• 2 user-programmable 24-V DC static or cyclic die protection inputs
• 7-digit stroke and batch counters with preset, and a 7-digit total counter
• Automatic variable-speed top-stop adjustment
  (for continuous mode only)
• Light curtain interface(s) with off/on selector
• Light curtain mute during the nonhazardous portion of the stroke
• 4 PLS (programmable limit switch) outputs—2 on/off angles, or 1 timed off, or 1 counted output per PLS (or 3 PLS outputs and 1 auxiliary output with 1 contact)
• Information displayed when the machine is in operation: angle, speed, batch counter, stroke counter, mode of operation, and stop time
• Display of text in English or Spanish

KEYPAD/DISPLAY
The keypad/display is used to enter setup information, monitor machine operation, and display messages to the user. The keypad/display has a 4-line x 20-character LCD (liquid crystal display) with 20 keys for entering information and programming. As standard, this keypad/display is mounted in the control box. For operator convenience, it can be furnished in a remote enclosure up to a maximum of 150’ from the SSC1500 control module (see page 27).

Information displayed during the machine run cycle includes:

• Angle
• Speed
• Batch Counter
• Stroke Counter
• Mode
• Stop Time

Example of the Main Run Screen on the Keypad/Display With Selector Switches
Part-revolution-clutch SSC1500 custom control boxes are also available to house the clutch/brake controls, disconnect switch, motor starters, and any other electrical components to fit your press room needs. A custom control box contains the standard control module and components as described on pages 21-22 plus the following:

- main power disconnect switch
- main drive motor starter
- ram-adjust motor starter (if required)

These boxes are furnished with an IEC through-the-door main power fused disconnect switch and an IEC magnetic motor starter (with push buttons). A reversing ram-adjust motor starter with selector and push buttons may also be included. They are prewired and built into a NEMA 12 enclosure.

Operator controls and the keypad/display are located on the front of the door, or a plain-door control or subpanel can be furnished. If a plain-door custom control or a subpanel custom control is ordered, a remote operator station or keypad/display kit is required. See ordering information on page 26.

NEMA-style disconnect switches and motor starters, and brand-name components specified by our customers are also available. To ensure the starter(s) and disconnect are sized properly, please check horsepower for the main drive motor and slide adjust motor (if furnished) on the press, as well as full-load amps, and primary voltage to the press. After obtaining this information, please go to the chart on page 27 to determine the proper custom control box part number. Make sure the proper suffix (F, P, S, K, C, X, Y, or Z) is in the part number. Follow directions 1-6 to determine the correct part number.

Example of part numbering system: The press requires a plain-door control and a 60-A disconnect switch (based on the full-load amp formula). It has a 10-HP motor, a reversing 32-A main motor starter without ram adjust, voltage is 230 V, and has a C4000 standard light curtain interface. The part number to order is PRC-224-PW. A remote operator station (Part No. LLD1506G2) is required for this plain-door control—see page 26.
SSC1500 REMOTE OPERATOR-STYLE CONTROL BOXES

These remote operator-style clutch/brake control boxes include the same features and modes of operation as the standard SSC1500 control boxes described on pages 21-22. However, they do not have a control transformer. These control boxes are designed to be located on the front of the machine near the operator.

These controls are for applications where the machine’s existing magnetic motor starter, fused disconnect switch, and control transformer meet the safety requirements and can be reused. If the existing control transformer cannot be reused or a new control transformer is required, please contact the factory.

The three standard remote operator-style control boxes available have the keypad/display and all operators on the door (front) of the 20” x 20” x 8” enclosure. Please see the next page for the three styles available.
SSC1500 REMOTE OPERATOR-STYLE CONTROL BOXES (CONTINUED)

STYLE X INCLUDES:
- Keypad/display
- Program off/on selector switch
- Mode selector switch
- Actuating means selector switch
- Light curtain off/on selector switch
- Internal clutch/brake control module, master control relay, and terminals

STYLE Y INCLUDES:
- Keypad/display
- Program off/on selector switch
- Mode selector switch
- Actuating means selector switch
- Light curtain off/on selector switch
- Internal clutch/brake control module, master control relay, and terminals
- Prior-action push button
- Self-latching emergency-stop button
- Top-stop button

Style Z Includes:
- Keypad/display
- Program off/on selector switch
- Mode selector switch
- Actuating means selector switch
- Light curtain off/on selector switch
- Internal clutch/brake control module, master control relay, and terminals
- Prior-action push button
- Self-latching emergency-stop button
- Top-stop button
- Two guarded run/inch buttons located on the sides of the enclosure
CONTROL MODULE KIT—PART NO. PRC-000-KW

A control module kit allows the end user to update the clutch/brake control of a press with minimum equipment costs. The kit is supplied without the control enclosure, panel, control transformer, control fuse, terminal strips, wire duct, and wiring.

A set of electrical prints is supplied to show typical wiring and all mounting dimensions are provided in order for a qualified person to install the control module kit. The minimum area required on an existing control panel to install this kit is 18" H x 18" W x 6" D.

This control module kit includes the control module, master control relay, shock mounts, fasteners, suppressors, danger labels, and electrical prints.

The SSC1500 control can be furnished as a subpanel that includes everything in the standard control as described on pages 21-22 except for the enclosure. The area needed to mount the subpanel inside an existing control box is 18½" H x 18½" W x 6" D. See page 27 to determine the part number for the module kit or subpanel. A keypad/display kit is required unless a remote operator station is used (see below).

If the continuous mode of operation is used, a prior-action station, Part No. LLD1500, is required. See page 31.

KEYPAD/DISPLAY KIT—PART NO. LLD1513G2

The keypad/display kit can be used with any of the control boxes or the control module kit. This kit includes the keypad/display, a program off/on selector switch, a light curtain off/on selector switch, a hand/foot selector switch, an off/inch/single/continuous selector switch, and 25’ of cable. Additional push buttons and nameplates for motor starters, etc., can be furnished depending on the features required. The area needed to mount the keypad/display kit is 10" H x 10½" W x 3½" D.

A resolver/pulser assembly and cable, Part No. CMS115, is required with any of the control selections. See page 28 for further details on this component.

REMOTE OPERATOR STATIONS

For operator convenience, a remote operator station can be furnished for use with a plain-door control box, plain-door custom control box, or control module kit. The remote operator station contains the keypad/display, program off/on selector switch, and other selector switches and push buttons as required.

Remote operator stations are available in a standard format or can be customized to meet any requirements. Select from the following remote operator stations or contact the factory with your special requirements.

If any of the above remote operator stations are required without the enclosure, please consult the factory.
SELECTING AN SSC1500 PART-REVOLUTION PRESS CONTROL

TO DETERMINE THE 8- OR 9-DIGIT CONFIGURED PART NUMBER FOR THE PART-REVOLUTION CONTROL REQUIRED, FOLLOW DIRECTIONS 1-6 BELOW AND USE THE INFORMATION IN THE PART NUMBERING SYSTEM CHART BELOW.

1. The first 3 digits for all SSC1500 part-revolution controls are PRC.
2. The 4th digit determines the size of the disconnect switch, if provided, in the control enclosure. Zero (0) indicates no disconnect switch provided.
3. The 5th and 6th digits determine the size and type of motor starter(s), if provided, in the control enclosure. Zeros (00) in both positions indicate no motor starter(s) provided.
4. The 7th digit determines the location of the operator controls, or if it is a style X, Y, or Z control without the control transformer.
5. The 8th digit is for the type of light curtain interface provided.
6. The 9th digit (if required) will indicate the type of modifier provided: i.e., motor control operators remote.

The sample shown, PRC-263-FB, indicates that the custom part-revolution control box with a Banner light curtain interface will contain an IEC 60-A disconnect switch, an IEC 25-A reversing main drive motor starter, and an IEC 12-A reversing ram-adjust motor starter. The keypad/display and all operators will be located on the door of the enclosure.

SSC1500 AND SSC3000 PRESS INDIVIDUAL COMPONENTS

RESOLVER/PULSER ASSEMBLY
Part No. CMS115*—40’ Cable
Part No. CMS115-100—100’ Cable

An absolute resolver/pulser timing device is required with the SSC1500 control to provide the angular position and velocity/motion information of the machine crankshaft to the control. The resolver is a highly accurate and repeatable device which uses an internally mounted photoelectric sensor and disk to verify the position of the crankshaft.

The resolver/pulser timing device is contained in a rugged, heavy-duty housing with a spring-compression base. The spring base helps isolate the resolver from shock load and vibration that are common occurrences on presses. This provides longer life for the components inside the enclosure. The spring base also functions as a drive chain tighter. This resolver/pulser assembly can also be furnished without the spring base when a direct-coupling drive is encountered. Please consult the factory.

The 3/4” diameter steel drive shaft with keyway is mounted in sealed ball bearings. This results in a rugged resolver assembly for press applications. The resolver/pulser is furnished with a 40’ cable (or optional 100’ cable) that connects to the drive assembly and wires in to the control box. The cable can be cut to length and wired to terminals.

SPROCKET ASSEMBLY
Part No. CML000*

A sprocket set consists of two sprockets. One fits on the 3/4” shaft of the CMS115 resolver/pulser assembly; the other sprocket is for mounting to the end of the press crankshaft. These 48-tooth sprockets are designed to accept ANSI No. 35 roller chain.

ROLLER CHAIN
Part No. CMS515*

ANSI No. 35 roller chain and master link is 10 feet long for driving the above sprockets.

*Included in a component package on page 34 or page 35.
**SSC1500 AND SSC3000 PRESS INDIVIDUAL COMPONENTS (CONTINUED)**

**MONITORED DUAL-SOLENOID AIR VALVE**

<table>
<thead>
<tr>
<th>PORTS</th>
<th>MONITORED DUAL-SOLENOID AIR VALVE</th>
</tr>
</thead>
<tbody>
<tr>
<td>1/2&quot; INLET / 1/2&quot; OUTLET PORT — Part No. RCL652</td>
<td></td>
</tr>
<tr>
<td>(for 10- to 25-ton presses)</td>
<td></td>
</tr>
<tr>
<td>2/3&quot; INLET / 3/4&quot; OUTLET PORT — Part No. RCL654*</td>
<td></td>
</tr>
<tr>
<td>(for 26- to 100-ton presses)</td>
<td></td>
</tr>
</tbody>
</table>

This three-way cross flow, series/parallel air valve includes an air pressure electrical output monitor and muffler. Air is put into the clutch and brake when the dual-solenoid air valve is electrically energized. When it is de-energized, the air is dumped through the muffler from the clutch and brake.

This valve consists of two main parts: the piloted monitor assembly and the valve body assembly. The two main valve elements move simultaneously during normal operation. If these elements should fail to move simultaneously, the internal spool shifts, inhibiting further machine operation. The pressure switch will provide a signal to the control system to indicate a fault condition. A reset button on the side of the valve can be used to reset the valve if an accidental valve fault is detected.

**MONITORED DUAL-SOLENOID AIR VALVE WITH RESET BUTTON**

<table>
<thead>
<tr>
<th>PORTS</th>
<th>MONITORED DUAL-SOLENOID AIR VALVE</th>
</tr>
</thead>
<tbody>
<tr>

<td></td>
</tr>
<tr>
<td>(for 301- to 1000-ton presses)</td>
<td></td>
</tr>
</tbody>
</table>

This cross flow, series/parallel air valve includes an air pressure electrical output and muffler. The separate reset button provides a remote reset at floor level if the valve latches out when an accidental air valve fault is detected. This valve is used for the clutch/brakes on large presses which require larger air volume capacity.

This valve assembly consists of a pilot, monitor, valve body, and junction box. It operates on the same principles as the 1/2" and 3/4" valves described above.

**NOTE:** If the clutch and brake are split, two valves may be required to provide good stopping times.

**FRL (FILTER-REGULATOR-LUBRICATOR)**

This assembly is required to meet the OSHA and ANSI standards. This FRL assembly filters, regulates, and lubricates the air going through it. This filtered and lubricated air then goes to the dual-solenoid air valve assembly and clutch/brake. The regulator should be adjusted to meet the original equipment manufacturer’s requirements. The assembly includes a gauge, coupling, and a steel mounting bracket. The FRL assembly can be used for any air-operated device on the press including the counterbalance or die cushion.

**AVERAGE CV (FLOW RATE)**

</tbody>
</table>

*Included in a component package on page 34 or page 35.
SSC1500 AND SSC3000 PRESS INDIVIDUAL COMPONENTS (CONTINUED)

AIR PRESSURE SWITCH
Part No. CTD062*
This air pressure switch monitors low pressure to either the clutch/brake air supply or slide counterbalance systems. Each system requires an air pressure switch. The pressure switch must be set so if the air pressure operating the component goes below a predetermined amount, the press becomes inoperable.

Each air pressure switch’s low level setting is based on each application and the machine manufacturer’s recommendations. The contact arrangement is 1 NO and 1 NC.

CHECK VALVE FOR COUNTERBALANCE SYSTEM
(not included in any component package on page 34 or page 35)
A check valve is required to meet the OSHA and ANSI standards. It maintains counterbalance surge tank pressure in the event of a sudden loss of air pressure. It is installed in the air line going to the tank. Please check the size of the air line going to the tank to determine the proper size valve.

Note: Press must have a counterbalance system with a surge tank to properly apply a check valve.

PALM BUTTON ASSEMBLY
To meet OSHA and ANSI safety standards, the two run/inch buttons must be protected against accidental operation (ring guards) and separated to require the use of both hands to operate them. They must also be mounted at the proper safety distance, if they will be used as a safeguard. The contact arrangement of these buttons is 1 NO and 1 NC.

Part No. CTL502*
This palm button assembly consists of two black run/inch buttons (with ring guards), a red emergency-stop button, and a yellow top-stop button. Mounting boxes are furnished with each button. The red and yellow palm buttons each have 1 NO and 1 NC arrangement. The red button is on a yellow-covered mounting box and is equipped with a mechanical latch to meet NFPA 79.

Part No. CTL507*
This palm button assembly consists of two black run/inch buttons (with ring guards), and a red emergency-stop button (for press applications without the continuous mode of operation). Mounting boxes are furnished with each button. The red palm button is on a yellow-covered mounting box and has 1 NO and 1 NC arrangement plus a mechanical latch to meet NFPA 79.

Palm buttons can also be furnished in a control bar along with push buttons and selector switches. Please see pages 49-50 for control bars, and pages 87-88 for other palm button assembly options.

*Included in a component package on page 34 or page 35.
FOOT SWITCH
Part No. CTD011* & CTD088
This foot switch is protected from unintentional operation. A die-cast cover protects the top and both sides, and the front is protected by a hinged flap. The flap must be lifted with the toe before the foot may enter the switch. The electrical contact arrangement is 1 NO and 1 NC.

PRIOR-ACTION STATION
Part No. LLD1500*
This prior-action station has a push button that must be depressed and released by the operator before depressing the actuating means in order to initiate the continuous mode of operation. This type of continuous mode of operation is sometimes referred to as “walk-away” continuous. This steel enclosure is 3½” x 3¼” x 3¼”. This prior-action station is also required when using the continuous-on-demand, automatic single-stroke, two-hand-maintained continuous, or foot-maintained continuous mode of operation. These modes of operation are furnished as standard features in the SSC1500 control.

SUPERVISORY CONTROL STATION
Part No. LLD1501
Part No. LLD283*
(required when a USC000 is used—see next page)
When two or more palm button or foot switch operating stations are required on one machine, one supervisory control station is required at each operator station. This remote control station consists of an off/on keyed selector switch and a station on indicator light. The on position allows the operator to use that station, and the off position deactivates only that station. The enclosure size is 5¼” x 3” x 3¼”.

BAR/RUN STATION (not included in any component package on page 34 or page 35)
Part No. LLD1502
This remote bar/run station can be used in conjunction with a manual turnover bar when setting dies in the press. The flywheel must have holes in the periphery for insertion of a spring-loaded turnover bar** (or the flywheel can be manually turned when the flywheel cover is removed). The remote station includes a three-position selector switch for bar/off/run, and one push button used for energizing the dual-solenoid air valve to engage the clutch and release the brake. The flywheel must be at rest (static) when engaging the clutch. After the clutch is engaged, the die setup person can manually turn the flywheel with a spring-loaded turnover bar (see page 86). The enclosure size is 5¼” x 3” x 3¼”.

*Included in a component package on page 34 or page 35.
**For a spring-loaded turnover bar, see page 86.
The optional crankshaft angle display is a unit that shows the angular position of the crankshaft for mechanical power presses. The crankshaft position is shown both graphically (with red LEDs in a circle) and numerically (with a large, red, three-digit LED). The large display can be easily seen which helps with setup, removal of stuck workpieces, or for assistance during emergency extraction procedures.

**FEATURES**

- Large LED numerical display and circular LED graphic display can be easily seen
- 6” x 6” x 2” enclosure
- Mounts easily
- Supplied with 25’ of cable for connection to the control
- Helps satisfy the requirements of Canadian Standard CSA Z142-02, Code for Power Press Operation: Health, Safety, and Guarding Requirements, for indication of crank angle position

*Included in a component package on page 34 or page 35.*
LOCKOUT VALVES (not included in any component packages on pages 34 or 35)

SLIDE-OPERATED VALVE
This three-way valve is operated with the manual movement of a slide that opens and closes the valve. This valve shuts off air at the press and then bleeds off downstream air. It can be locked only in the off position.

MANUAL VALVE
This manually operated valve shuts off airflow when a machine needs to be locked out. To shut off and exhaust air in the line, the handle is pushed in. This causes the pressurized supply of air to be blocked, and the downstream air in the line is exhausted through the exhaust port and muffler at the bottom of the valve. The valve can be padlocked in the off position. The valve is furnished with a muffler. Port sizes available for air flow are 3/4" and 1".

MANUAL PILOT VALVE
This manually operated pilot valve is used in larger air systems. It is available for port sizes of 1½" and 2½". It operates in a similar manner as the manual valve. By pushing the handle in or out, it controls pilot pressure to a piston which opens or closes the valve’s inlet poppet. It is designed to be locked only in the off position. This valve is furnished with a muffler.

EEZ-ON VALVE
This valve shuts off air supply to the machine and bleeds downstream air when the valve is closed. When the valve is open, it gradually allows air into the air system to prevent damage to air components. It can be locked only in the off position. This valve is furnished with a muffler.

## SELECTING AN SSC1500 PRESS COMPONENT PACKAGE

To complete the SSC1500 control system, component packages are available. Component packages are listed in the charts below and on the next page. These packages can be furnished with:

- A STANDARD CONTROL
- A CUSTOM CONTROL
- A CONSOLE CONTROL
- A SPECIAL CONTROL
- A REMOTE OPERATOR-STYLE CONTROL
- A SUBPANEL
- A CONTROL MODULE KIT

To select the proper component package to go with your control box, determine your requirements below:

A MODES OF OPERATION AND ACTUATING MEANS REQUIRED.

B NUMBER OF OPERATOR STATIONS REQUIRED.

C NUMBER OF AIR PRESSURE SWITCHES REQUIRED.

<table>
<thead>

Part-Revolution Press With Clutch/Brake Control System With Point-of-Operation Guards
**SSC3000 STANDARD CONTROL**

The SSC3000 solid-state press automation control is designed for use on part-revolution-clutch mechanical power presses. The SSC3000 is a rack-mounted modular control system with expandable options. These expandable options permit changes to be made, or features to be added or deleted as press requirements change. If additional features are required, plug-in cards and/or additional equipment can be added.

The basic design allows the user or OEM (original equipment manufacturer) to apply automation to mechanical power presses. The automation is usually applied to primary machines that operate in modes of continuous, automatic single stroke, or continuous-on-demand. This control can also be applied to presses that operate in the single-stroke mode of operation to perform manual secondary jobs that may be required to run automatic modes later.

The standard control box is in a 30" x 30" x 10" NEMA 12 enclosure with the operator controls and touch screen/display located in a remote operator station. The standard automation control rack is furnished with a power supply module and a Main CPU (central processing unit) Card.

The rack is designed to hold eight additional cards for expandable options. These card options include: Clutch/Brake Control, PLS (programmable limit switch), Die Protection, Load Monitor, and Angle Display.

Timing functions of the SSC3000 press automation control system are generated from a rotary resolver/pulser assembly. This gives absolute position of the crankshaft (rotary) position.

If a starter or disconnect is required in the same enclosure as the standard SSC3000 control, see page 40, SSC3000 custom control box. If a separate starter or disconnect, or combination starter disconnect is required, refer to our Safety Shields catalog.
**SSC3000 CUSTOM CONTROL**

A part-revolution-clutch SSC3000 custom control box is also available to fit your particular press room needs. This control includes the same features and modes of operation as the standard SSC3000 control box described on the previous page.

A custom SSC3000 solid-state press automation control box includes a multi-tap transformer, modular control rack with power supply, and a Main CPU Card. It is furnished with an IEC through-the-door main power fused disconnect switch, an IEC magnetic motor starter(s) for the main drive motor and, a motor starter for the ram-adjust motor, if applicable. The operator controls and the touch screen/display can be located on the door, or they can be located in a remote operator station for use with a plain-door custom control box. NEMA disconnect switches and starters are also available.

To ensure the starter(s) and disconnect are sized properly, please check horsepower for the main drive motor and ram-adjust motor (if furnished) on the press, as well as full-load amps, and primary voltage to the press. After obtaining this information, please go to page 45 to determine the proper custom control box part number. Follow directions 1-7 to obtain the correct part number.

---

**SSC3000 MODULAR CONTROL RACK KIT**

The modular control rack kit can be furnished when the existing control enclosure is retained. The minimum area required on an existing control panel inside the control box to install the rack kit is 15” H x 18” W x 10” D. This kit includes a master control relay, the modular control rack, a power supply, and a Main CPU Card. A dual CPU press Clutch/Brake Controller Card and other expandable card options can be added (see pages 42-44). A complete sign package, installation manual, instructions, and electrical diagrams are furnished.

---

**SSC3000 TOUCH SCREEN/DISPLAY KIT**

The touch screen/display kit includes the touch screen/display, an off/program/run selector, a mode selector, an actuating means selector, and a light curtain off/on selector switch, and 25’ of cable. The space required to mount the touch screen/display kit is 12” H x 10” W x 3” D. A remote operator station can also be furnished that has the touch screen/display kit in an enclosure. See the next page for choices of operator stations.
SSC3000 REMOTE OPERATOR STATIONS

A remote operator station or operator kit—containing the touch screen/display, off/program/run selector switch, other selector switches, and push buttons as required—is always necessary with the press automation control system.

Remote operator stations or kits are available in a standard format or can be customized to meet any requirements. Select from the following or contact the factory with your special requirements. If the Clutch/Brake Controller Card is not provided as a part of the press automation control system, contact the factory for a special remote operator station.

An additional light curtain off/on selector switch can be added to the above operator stations or kits. The additional selector switch is used when two independent light curtain systems are required. Please consult the factory.
SSC3000 BASIC SYSTEM FEATURES

MODULAR RACK DESIGN
The SSC3000 press automation control consists of a modular control rack with power supply and a Main CPU (central processing unit) Card. The control rack is mounted to the panel with shock/vibration mounts and measures 9½” H x 17½” W x 6” D. This modular rack is designed with additional slots for adding expandable card options to provide the automation features you need for your press.

MAIN CPU CARD
Part No. FRL-318
The SSC3000 press automation control Main CPU Card provides all the main processing for the base automation system. There are red and green LEDs (light-emitting diodes) that allow for visual indication of control operation and the status of inputs and outputs. All LED names are indicated on the cover of the Main CPU Card.

Main CPU Card Features
User Inputs
Twelve (12) programmable user inputs are dedicated to machine diagnostics. They can be programmed for equipment monitoring or other user-defined functions. After programming the 12 inputs, the current status of these inputs can be displayed on the touch screen. When a fault condition is detected, the machine will stop or emergency stop, and the assigned message will be displayed on the touch screen from the list below. An additional ten (10) user-defined messages can be added to this list.

Standard User Input Fault Messages
- Clutch/Brake Air Fault
- Counterbalance Air Fault
- Dual Solenoid Fault
- Clutch Valve Fault*
- Brake Valve Fault*
- Lube Fault
- High Lube Pressure
- Low Lube Pressure
- Low Lube Level
- Main Motor Overload
- Ram-Adjust Motor Overload
- Lube Motor Overload
- Auxiliary Motor Overload
- Guard Interlock Open
- Front Guard Open
- Rear Guard Open
- Left Side Guard Open
- Right Side Guard Open
- Feeder Fault
- Load Monitor Fault
- Safety Block Interlock
- Shut Height Fault
- Variable Speed Drive Fault
- Die Protection Fault**
- Short Feed Fault**
- Part Ejection Fault**
- Stock Buckle Fault**
- End of Stock Fault**
- Pilot Pin Fault**
- Part Input #1**
- Part Input #2**
- Part Input #3**

*Used when two valves are furnished for split clutch/brake
**Messages typically used for die protection
**SSC3000 BASIC SYSTEM FEATURES (CONTINUED)**

**MAIN CPU CARD FEATURES (CONTINUED)**

**TIME-BASED BRAKE MONITOR**
A time-based programmable brake monitor (stopping performance monitor) with both warning and fault setpoints is included.

**STM (STOP-TIME MEASUREMENT) TEST**
The control includes a stop-time measurement test. This is used for establishing and maintaining the proper safety distance when applying two-hand control or light curtains as the safeguarding method.

**100-JOB SETUP MEMORY**
Up to 100 job setups can be stored in memory allowing for quick changeover from die to die. The die number, description, PLS outputs, die protection inputs, load monitor settings, servo feed, and counter information can be saved for each job.

**COUNTERS**
The batch and stroke counters can be used for die maintenance, quality control checks, or part bin exchanges. Each of these counters has a programmable preset and when it reaches the preset, the machine will top stop. The counters and presets are also saved in job memory. There is also a total counter which has security code protection. All of these counters can be displayed on the touch screen.

**SYSTEM SETUP**
The system setup screen is used to automatically zero the resolver, set the motion reference threshold, automatically set the sync switch position, and set the SPM (strokes per minute) range.

**USER MESSAGES**
Up to 10 user-defined programmable messages can be added to the general fault message list. These customized messages can be used with all user inputs and die protection inputs. The messages can be alphanumeric up to 24 characters.

**PASSWORD CONTROL**
The password control screen is used to enter a supervisor security code, an operator security code, and to assign the level of security code protection—none, operator, or supervisor. The security code is user-programmed up to 5 alphanumeric characters.
SSC3000 EXPANDABLE OPTIONS

DUAL CPU PRESS CLUTCH/BRACE CONTROL CARD
Part No. FTL319

The Dual CPU Press Clutch/Brake Control Card is designed to comply with OSHA 29 CFR 1910.217, and ANSI B11.1 and B11.19. This is accomplished by a redundant cross-checking, active dual-microprocessor control system. The system uses redundant inputs from devices such as palm buttons, foot switches, and light curtains. The system output to the solenoid valve(s) is provided by two monitored 24-V force-guided output relays. These primary safety output relays are independently controlled and cross-checked by the microprocessors. This allows control-reliable operation of the outputs in the event of a single control component failure. Each microprocessor also has its own logic power supply. This decreases the possibility of simultaneous control failure because of a fault within the power supply system. All inputs and outputs are optically isolated for electrical noise immunity. The Clutch/Brake Control Card also provides angle settings, timed settings, optional modes, variable speed settings, and a part-in-place input.

Angular position of the crankshaft is provided by a single absolute resolver/pulser. A photoelectric sensor in the rotary timing device provides a synchronous signal which verifies the angular position.

Note: Please furnish the electrical schematics if special feeding or transfer equipment will be used on the press when the Dual CPU Press Clutch/Brake Card is used.

STANDARD MODES OF OPERATION
- Two-hand inch (regular or timed)
- Two-hand single stroke
- Foot single stroke
- Two-hand “walk-away” continuous
- Continuous-on-demand
- Automatic single stroke
- Two-hand-maintained continuous
- Foot-maintained continuous
- One-hand or foot trip single stroke (use with light curtain or interlocked guard only)

PLS (PROGRAMMABLE LIMIT SWITCH) CARD
Part No. FTL320

The 8-Output PLS Card is designed to provide user-programmable outputs that can be used to sequence events during the press stroke. Up to two 8-Output PLS Cards can be used for a total of 16 outputs. All outputs have depluggable terminal strips with LED (light-emitting diode) indicators for easy installation and maintenance. The programmed PLS settings for each die are stored in job memory for QDC (quick die change).

PLS outputs can be used for automatic operations such as lube mist, air blow off, or feed initiation. Each output has a programmable on and off angle.

The outputs can also be programmed to turn off after a preset period of time in hundredths of a second. This “timed output” setting overrides any off angle setting.

A counter for counted output can also be programmed for auxiliary devices, such as lube or oil systems. This counter can be interfaced to the PLS Card to provide an output signal when the counter setting is reached. For example, if an oil mist is required every three cycles, the counter setting is set to 3 strokes. When the counter reaches 3 strokes, the PLS output turns on and the oil mist is sprayed over the workpiece or die. The counter is then reset, and the cycle starts over.
SSC3000 EXPANDABLE OPTIONS (CONTINUED)

DIE PROTECTION CARD
Part No. FTL321
The 8-Input Die Protection Card is designed to provide user-programmable inputs that monitor static or cyclic events during the press stroke. Up to three 8-Input Die Protection Cards can be used for a total of 24 inputs. The 24-V DC inputs have individual jumpers that set each input to current sinking or sourcing. All inputs have depluggable terminal strips with LED indicators for easy installation and maintenance.

The die protection inputs can be used for equipment monitoring, die protection, or other user-defined functions. Five (5) parameters can be programmed for each input: logic, stop type, open angle, close angle, and fault message. Ten (10) user-defined messages exist at the end of the user-programmable fault list. These ten messages can be edited by the user via the programmable options in the main program screen.

ANGLE DISPLAY CARD
Part No. FTL323
The Angle Display Card is used in conjunction with the crankshaft angle display described below. The crankshaft angle display unit must be purchased in addition to the angle display card.

CRANKSHAFT ANGLE DISPLAY UNIT
Part No. FTL054
The optional crankshaft angle display is a unit that shows the angular position of the crankshaft for mechanical power presses. The crankshaft position is shown both graphically (with red LEDs in a circle) and numerically (with a large, red, three-digit LED). The large display can be easily seen which helps with setup, removal of stuck workpieces, or for assistance during emergency extraction procedures. The Angle Display Card must be purchased in conjunction with this crankshaft angle display unit.

FEATURES
• Large LED numerical display and circular LED graphic display can be easily seen
• 6” x 6” x 2” enclosure
• Mounts easily
• Supplied with 25’ of cable for connection to the control
• Helps satisfy the requirements of Canadian Standard CSA Z142-02, Code for Power Press Operation: Health, Safety, and Guarding Requirements, for indication of crank angle position

LOAD MONITOR SYSTEM
Load Monitor Card
Part No. FTL322
The SSC3000 control is designed to accept one or two Load (tonnage) Monitor Cards in the main rack. Each card is capable of monitoring the machine load at four locations on the machine frame or components. Four to eight load cells can be installed on the machine to read up to a maximum of eight zones of tonnage overload—four load cells per Load Monitor Card.

The Load Monitor Card is programmable through the SSC3000 touch screen/display. The minimum and maximum tonnage can be set manually or with a learn key. The learn key will add 10% to or subtract 10% from the current high and low settings. When enabled, a stop signal will be given when an over or under tonnage setting is detected. The system for load monitoring also requires a load monitor control module and sensors (see next page).
SSC3000 EXPANDABLE OPTIONS (CONTINUED)

LOAD MONITOR SYSTEM (CONTINUED)

Load Monitor Control Module
Part No. RYL102

The load monitor control module (9” H x 2 1/4” W x 4” D) detects the underload or overload information that is generated at each load sensor on the machine frame or component—available in a two- or four-cell sensor kit. In order to use the load monitor system, the machine must be calibrated with calibration cells. This is done after installing the press automation control equipment and sensors. For further details on calibrating the load monitor system, please consult the factory.

The Load Monitor Card must be purchased in conjunction with the load monitor control module and sensor kit.

SERVO FEED INTERFACE

A servo feed interface option is available that will communicate with the existing servo feed controller currently attached to the press or a feed that is being purchased. This interface can automate the setting for the feed length and feed rate. This speeds up die changeover because this information is stored once and then sent to the servo feed control when the tooling is changed. The interface consists of a connecting cable, electrical print, and software. Please furnish the manufacturer, model, and serial number of the servo feed to be interfaced.

OBI With Press Automation System and Servo Feed Interface
SELECTING AN SSC3000 PRESS AUTOMATION CONTROL

To determine the 18-digit part number for the press automation control required, follow the directions given below and use the information in the PART NUMBERING SYSTEM CHART below.

1. The first 5 digits for all press automation controls are PACG2.
2. The 6th digit determines the location of the operator controls.
3. The 7th digit determines the size of the disconnect switch, if provided, in the control enclosure. Zero (0) indicates no disconnect switch provided.
4. The 8th and 9th digits determine the size and type of motor starter(s), if provided, in the control enclosure. Zeros (00) in both positions indicate no motor starter(s) provided.
5. The 10th digit is for the type of light curtain interface provided on the electrical schematics.
6. The 11th digit indicates if a Clutch/Brake Controller Card is required. Zero (0) indicates none is required.
7. The 12th through the 18th digits are for the expandable rack slot options or slot covers, i.e., PLS, Die Protection, Load Monitor, Angle Display Card, and/or slot covers.

SAMPLE

P A C G 2 - P 2 6 4 - W A B C D X X

The sample shown, PACG2-P264-WAABCDXXX, indicates that the plain-door custom part-revolution control box will contain a C4000 Standard light curtain interface, an IEC 60-A disconnect switch, an IEC 30A reversing main drive motor starter, and an IEC reversing 12-A reversing ram adjust motor starter. The control will contain the Clutch/Brake Controller Card, an 8-output PLS Card, an 8-input Die-Protection Card, a 4-input Load Monitor Card, an Angle Display Card, and three slot covers.

SSC3000 PRESS AUTOMATION CONTROL PART NUMBERING SYSTEM CHART

* An RYL102 load monitor control module and sensor kit(s) are needed in addition to the load monitor card—see pages 43-44.
** An FTL054 crankshaft angle display unit is needed in addition to the angle display card—see page 43.
SSC3000 COMPONENT PACKAGES

To complete the SSC3000 control system, component packages are available to use with the SSC3000 control box. These component packages are similar to those listed on pages 34 and 35 for use with the SSC1500 control box; however the prior-action component part number changes within the component packages listed on page 36—see below.

The prior-action station included with the continuous mode of operation component packages is Part No. LLD3000. This replaces the prior-action station Part No. LLD1500 in the component packages listed on page 36.

The component package part number also changes when ordering an SSC3000 component package. Change the selected component package’s part number suffix -SSP listed on pages 34-35 to the suffix -SSC when ordering an SSC3000 component package.

SSC3000 INDIVIDUAL COMPONENTS

PRIOR-ACTION STATION—Part No. LLD3000*

This prior-action station has an illuminated push button that must be depressed and released by the operator before depressing the actuating means in order to initiate the continuous mode of operation. This steel enclosure is 3½” x 3¼” x 3¼”. The prior-action station is required when using the “walk-away” continuous, continuous-on-demand, automatic single stroke, two-hand-maintained continuous, or foot-maintained continuous mode of operation. These modes of operation are standard features of the SSC3000 control.

SUPERVISORY CONTROL STATION

Part No. LLD3001
Part No. LLD283* (required when a USC000 is used—see below)

When multiple operator stations are required, this supervisory control station is furnished separately for each set of palm buttons and/or foot switch operator station. It has its own enclosure and includes an off/on key-operated selector switch and a green on indicator light. The enclosure size is 5¼” x 3” x 3¼”.

BAR/RUN STATION (NOT INCLUDED IN ANY COMPONENT PACKAGE)

Part No. LLD3002

This remote bar/run station can be used in conjunction with a manual turnover bar when setting dies in the press. The flywheel must have holes in the periphery for insertion of a spring-loaded** turnover bar (or the flywheel can be manually turned when the flywheel cover is removed). The remote station includes a three-position selector switch for bar/off/run, and one push button used for energizing the dual-solenoid air valve to engage the clutch and release the brake. The flywheel must be at rest (static) when engaging the clutch. After the clutch is engaged, the die setup person can manually turn the flywheel with a spring-loaded turnover bar (see page 86). The enclosure size is 5¼” x 3” x 3¼”.

MULTIPLE-OPERATOR JUNCTION BOX

PART NO. USC000*

When multiple operator stations are required, this junction box is furnished separately for wiring up to four (4) operator stations. This junction box interfaces palm button assemblies/control bars and foot switches, and will not allow the press to run if palm buttons or a foot switch is actuated without its supervisory control station on. A lighted push button with nameplate indicates a fault condition of an operator station. The button is pushed to reset. The enclosure size is 16” x 14” x 6”.

* Included in an SSC3000 component package on page 36 or page 37 after changing the suffix -SSP to -SSC in the component package number.

** For a spring-loaded turnover bar, see page 86.
CONTROL CONSOLES

All of the previously mentioned part-revolution-clutch controls can be furnished as special control systems engineered to your specifications. Please consult the factory for further details on your requirements. This page illustrate some examples of special controls that can be designed.

A floor-standing console contains the clutch/brake or hydraulic controls and motor controls mounted inside on subpanels. These are typically used on high-speed or large presses. Consoles are used in place of controls mounted to the machine to avoid extreme press shock vibration. Isolating the press controls in the console gives electrical components a longer life. Control consoles are usually furnished in oil-tight enclosures which have a sloped top for operator convenience. Casters are optionally available to provide mobility of the console. The enclosure door has a lockable handle so that unauthorized personnel cannot tamper with the controls.

These consoles may be furnished with IEC or NEMA disconnect switches and magnetic motor starters. The disconnect handle is located on the enclosure door (lockable in the off position). The starter push buttons (and selector, when a reversing starter is furnished) are located on the sloped front. These consoles are available in the configuration shown or any other way that meets your requirements. User-supplied or user-specified components can also be incorporated into these control consoles.

Please furnish exact motor horsepower, voltage, and full-load amps when ordering disconnect switches and motor starters.

SPECIAL CONTROLS

Have you ever been in a position where you required a unique control, but lacked the time or expertise to design one? If so, we can help you. We have the knowledge and experience to design, manufacture, and install a control panel or an entire control system to meet your specific requirements.

At your request, our safety control specialists can visit your plant to determine exactly what is required or you can mail us your existing prints. A proposal will be submitted to you detailing the exact specifications and costs involved.

Our engineering personnel will design the circuit for the control system. Every control is designed to the applicable OSHA and ANSI standards. The final stage of design results in a complete set of control circuit schematics, connection and layout diagrams.

Next, the control design is sent to our production department. Control panel assembly begins here with the layout and wiring of the control. After the manufacture of the control is complete, it is subject to a rigorous testing procedure which ensures proper operation.

If you require installation of the special control, we have highly skilled installation crews that are available to install the control system or to instruct your own maintenance personnel.

Each special machine control we design can be unique. You have our commitment to quality.
REMOTE MOTOR CONTROL OPERATOR STATIONS FOR USE WITH SSC1500 PRESS CONTROLS, SSC3000 PRESS CONTROLS, AND SSC1500 PRESS BRAKE CONTROLS

Part No. VOS1000
— For use with nonreversing motor starters
This 6¾” x 3½” x 3” station is a motor control green start push button and a red stop push button in a NEMA 12 metal enclosure.

Part No. VOS1100
— For use with reversing motor starters
This 8¾” x 3½” x 3” station is a motor control green start push button, a red stop push button, and a two-position forward/reverse selector switch in a NEMA 12 metal enclosure.

Part No. LLD3213
— For use with reversing ram adjust motor starters
This 8¾” x 3½” x 3” station has black ram raise and ram lower push buttons, and a two-position ram-adjust off/on selector switch in a NEMA 12 metal enclosure.

Part No. LLD3215
— For use with reversing main motor starters and reversing ram-adjust motor starters
This 8¾” x 6¼” x 3¾” station has a two-position ram-adjust off/on selector switch, black ram raise and ram lower push buttons, a two-position forward/reverse selector switch, a motor control green start push button, and a red stop push button in a NEMA 12 metal enclosure.

Part No. LLD3214
— For use with nonreversing main motor starters and reversing ram-adjust motor starters
This 8¾” x 6¼” x 3¾” station has a two-position ram-adjust off/on selector switch, black ram raise and ram lower push buttons, a motor control green start push button, and a red stop push button in a NEMA 12 metal enclosure.
CONTROL BARS

Control bars of various configurations can be provided to mount either to the machine or on a pedestal-type floor stand. The standard control bars can have various guarded run/inch palm buttons, emergency-stop and top-stop palm buttons, a multiple operator supervisory station selector switch with indicator light, and either of two types of prior-action push buttons. Please refer to the CONTROL BAR PART NUMBERING SYSTEM CHART on the next page to obtain the part number of the standard control bar required.

Special control bars can be provided with other required selector switches and indicator lights, depending on the individual requirements. Consult the factory for pricing and delivery when a special control bar is required.

FLOOR STANDS FOR CONTROL BARS

Control bars and any palm button assembly can be furnished with either of these floor stands.

Part No. KCL000
—Floor Stand With Base and Top Plate
This 37” nonadjustable heavy-duty floor stand includes a top plate and a 4” x 4” column. The base has four holes for permanent attachment to the floor; bolts are not furnished.

Part No. KCL017
—Adjustable Floor Stand With Base and Top Plate
The adjustable column (28” to 47”) on this floor stand can easily be moved up and down for operator comfort. A hand tool is required to make adjustments. The base has four holes for permanent attachment to the floor; bolts are not furnished. Custom heights are available. Please consult the factory.
SELECTING A CONTROL BAR

To determine the 7- or 8-digit configured part number for a standard control bar, follow directions 1-6 below and use the information in the CONTROL BAR PART NUMBERING SYSTEM CHART below.

1. The first 3 digits for all control bars are MCB or USC.
2. The 4th digit determines the size of the bar enclosure.
3. The 5th digit determines the type of run/inch button provided.
4. The 6th digit determines the type of emergency-stop button provided.
5. The 7th digit determines the type of top-stop or return button provided.
6. The 8th digit will indicate the type of modifier provided; e.g., supervisory selector switch, indicator light, and prior-action push button.

### RUN BUTTON OPERATOR TYPE

1 — Rees Black Palm Button With Rockford Systems Guards—Front Only
2 — A-B Articulated Palm Button With A-B Guards—Front Only
3 — N/A
4 — IDEC Green Push Button With IDEC Guard
5 — A-B Zero-Force Touch Buttons With Guards (90-264 VAC)
6 — Banner Opto-Touch Buttons With Guards (20-30 VAC/DC)
7 — Mushroom Push Buttons With Guards (SQ-D)
8 — Rees Chrome Light-Push Button With Rockford Systems Guards—Front Only

### OPERATOR AND EMERGENCY-STOP TYPE BUTTONS FOR CONTROL BARS

- Rees Black Palm Button With RSI Guard
- A-B Articulated Palm Button With A-B Guard
- IDEC Button With Guard
- A-B Zero-Force Touch Button With Guard
- Opto-Touch Button with Guard
- Mushroom Push Button With Guard (SQ-D)
- Rees Chrome Light-Push Button With RSI Guard
- Rees Red E-Stop Button—Latch-Out
- A-B Red Two-Position E-Stop—Twist-to-Return

All buttons have 1 NO and 1 NC contact arrangement.
Each hydraulic power press must be looked at as an individual system. This system consists of, but is not limited to, the machine frame, all mechanical parts, hydraulic system, electrical or electronic systems, pneumatic systems, tooling or dies (present and future), tool or die setup, safeguarding, material handling, size or configuration of workpiece, maintenance requirements, and most importantly, production requirements.

OSHA REGULATIONS

For hydraulic power presses, the main safety requirements that must be complied with fall under OSHA 29 CFR 1910.212, General Requirements for all Machines. This section of the CFR requires point-of-operation safeguarding.

If auxiliary equipment on the hydraulic power press has mechanical power-transmission apparatuses, then OSHA 29 CFR 1910.219 must be complied with. For lockout/tagout requirements, OSHA 29 CFR 1910.147 should be referenced.

ANSI STANDARDS

There are several references available on hydraulic press safety; however, most end-users rely on the ANSI (American National Standards Institute) B11.2 standard for best safety practices.

In ANSI B11.2, subclause 6.3 Control System, it states that “All components and subsystems of the control system shall be designed to operate together to provide total system compliance with the requirements of this clause. Control components shall be selected, constructed and connected together in such a way as to withstand expected operational and environmental stresses. The control system shall meet the following design and construction requirements.”

6.3.1 PRESS PUMP MOTORS

The control system shall not permit the initiation of slide(s) motion unless at least one pump motor is running. This requirement may not apply to die setting operations—see subclause 9.2.3 in ANSI B11.2.

6.3.2 POWER FAILURE

The control system shall be designed so that in the event of power failure, restoration of power will not result in any hazardous slide motion.

6.3.3 CONTROL RELIABILITY

Control systems shall be designed and constructed so a single failure or fault within the system:

1. Does not prevent the normal stopping action from being applied to the press, when required;
2. Does not create unintended slide motion;
3. Does prevent initiation of a successive stroke until the failure is corrected.

See Electrical Requirements in this section for other requirements found in ANSI B11.2.

6.6.5 HYDRAULIC COMPONENTS AND CIRCUITS

Hydraulic component circuits that control slide(s) motion shall comply with the requirements of 6.3.3.

CONTROLS

The controls described in this catalog include two-hand control as a point-of-operation safeguarding device. The palm buttons must be depressed concurrently and maintained during the hazardous downstroke of the ram. Release of one or both palm buttons reverses or stops the action of the ram. The controls offered also include a light curtain interface.

ELECTRICAL REQUIREMENTS

The ANSI B11.2 standard requires a proper main power disconnect switch. A motor starter is also required that drops out when power is lost and will not restart automatically. All AC control circuits and solenoid valves must be powered by 120 V or less (obtained from the transformer), and the control system must be protected against false operation due to an accidental ground.

UPDATING HYDRAULIC POWER PRESSES

To update the electrical system or to add point-of-operation safeguarding to hydraulic power presses, the electrical and hydraulic schematic diagrams must be reviewed by Rockford Systems’ engineering department. Please provide these schematics to our sales personnel or factory-authorized representatives when they visit your plant to conduct a machine survey.
STANDARD HYDRAULIC POWER PRESS CONTROL

This solid-state control system is designed for use on hydraulic power presses. It is designed and built to comply with OSHA 29 CFR 1910.212 and ANSI B11.2 and B11.19. This control can update or replace existing control systems on hydraulic power presses found in users’ plants or can be furnished for new or rebuilt hydraulic power presses.

This control includes control reliability, two-hand control, light curtain interface, and diagnostics (one user-programmable input). It also includes batch and stroke counters with presets, and a hard-wired emergency-stop master control relay.

This is an economic, full-featured dual micro-processor-based control system. The system uses redundant inputs from devices such as palm buttons, foot switches, and light curtain(s). The system output to the solenoid valves is provided by two force-guided relays. These output relays are independently controlled and cross-checked by the microprocessors. This allows control-reliable operation of the outputs in the event of a single control component failure in the control. The standard hydraulic power press control has minimum requirements for the press it is to control. These minimum requirements include a directional or one up and one down solenoid valve(s) for the ram, a TOS (top-of-stroke) limit switch, and a BOS (bottom-of-stroke) limit or pressure switch. In most cases, if these already exist, they can be reused. Speed-change valves and limit switches can also be supported with the standard hydraulic control. If other valves exist (additional speed change valves, prefill, regeneration, level, bypass, etc.), please consult the factory for a quote on a special-designed control.

The standard control box is a 20” x 20” x 8” NEMA 12 enclosure with the operator controls and keypad/display mounted in the door, as illustrated above.

A starter or disconnect can be included in a larger enclosure, or a combination starter disconnect can be furnished separately.
STANDARD HYDRAULIC POWER PRESS CONTROL (CONTINUED)

OPERATOR INTERFACE KEYPAD/DISPLAY
The operator interface keypad/display is used to enter setup information, monitor machine operation, and display messages on a 4-line x 20-character LCD (liquid crystal display). As standard, this keypad is mounted on the control box door. For operator convenience, it can be installed in a remote operator station. Programming is accessed by a keyed selector switch.

PROGRAMMING
The hydraulic power press control can be quickly and easily programmed. There is one 24-V DC selectable current-sinking or sourcing programmable diagnostic input provided for the user. A fault message, input logic, and stop type can be assigned to the input from the user input fault message list. When a fault condition is detected, the machine will top stop or emergency stop, and the assigned message will be displayed. This feature helps when troubleshooting common fault conditions.

MODES OF OPERATION
- Off
- Two-hand inch
- Two-hand single stroke
- Foot single stroke
- Foot switch trip or one-hand trip single stroke (used in conjunction with a point-of-operation safeguard)*
- High, high/low, low speed change
- Two-hand automatic (continuous)
- Automatic single stroke*
*Additional components may be required to use this mode of operation.

FEATURES
- Meets and exceeds OSHA 29 CFR 1910.212 and ANSI B11.2 and B11.19
- Provides two-hand control safeguarding device
- Redundant and cross-checking microprocessors
- Redundant switching style DC power supplies
- Two monitored ram advance (up or down) 24-V force-guided output relays
- External relay monitoring (for use when external relays are used to energize the down valves)
- Blocking valve monitoring
- Press control operates on 85-135 VAC
- Provisions for optional light curtain interface with off/on supervised keyed selector switch
- Easy to read back-lit liquid crystal operator interface display having 4 lines x 20 characters
- One (1) 24-V DC digital user input, programmable, selectable canned message
- One (1) ram speed change (fast-slow) output, standard 120 VAC with a selector switch for high, high/low, low speed (to support machines with a speed change solenoid valve)
- One (1) ram return (up or down) output, standard 120 VAC with a selector switch for pressure, pressure/distance, distance return
- Bottom dwell timer (0-600 seconds)
- Decompression timer (50-250 ms)
- 7-digit stroke counter
- 7-digit batch counter with preset
- Operator interface keypad and display, text in English or Spanish
CUSTOM HYDRAULIC POWER PRESS CONTROL

A custom control box contains the standard control module and components described on pages 52-53 plus the following:

- main power disconnect switch
- main hydraulic pump motor starter

The box will vary in size based on the disconnect switch and motor starter components. The box is furnished with an IEC through-the-door main power fused disconnect switch and an IEC hydraulic pump magnetic motor starter (with push buttons). They are prewired and built into a NEMA 12 enclosure.

Operator controls and the keypad/display are located on the front of the door, or a plain-door control or subpanel can be furnished. A remote operator station or keypad/display kit is required if a plain-door control or subpanel is ordered. See the next page for information on remote operator stations.

To ensure the starter(s) and disconnect are sized properly, please check horsepower for the main hydraulic pump motor on the machine, as well as full-load amps and primary voltage to the machine. After obtaining this information, go to the chart on page 56 to determine the proper custom control box part number. Follow directions 1-7 to determine the correct part number.

REMOTE OPERATOR-STYLE CONTROL BOXES

Remote operator-style X, Y, and Z hydraulic control boxes include the same features and modes of operation as the standard hydraulic control boxes. However, they do not have a control transformer. These control boxes are designed to be located on the front of the machine near the operator.

These controls are for applications where the machine’s existing magnetic motor starter, fused disconnect switch, and control transformer meet the safety requirements and can be reused. If the existing control transformer cannot be reused or a new one is required, please contact the factory.

The keypad/display and all operator controls are located on the door (front) of the remote operator-style control box.

CONTROL MODULE KIT

A control module kit allows the end user to update the hydraulic control of a press with minimum equipment costs. The kit is supplied without the control enclosure, panel, control transformer, control fuse, terminal strips, wire duct, and wiring.

A set of electrical prints is supplied to show typical wiring, and all mounting dimensions are provided in order for a qualified person to install the control module kit. The minimum area required on an existing control panel to install this kit is 18” H x 18” W x 6” D.

This control module kit includes the control module, control relays, shock mounts, fasteners, suppressors, danger labels, and electrical prints. A keypad/display kit is required unless a remote operator station is used (see next page).

If the automatic (continuous) mode of operation is used, a prior-action station—Part No. LLD6100—is required. See page 57.

SUBPANEL

A subpanel control can also be furnished. It is the same as the standard control described on pages 52-53 without the enclosure. The minimum area required in an existing control enclosure is 181/2” H x 181/2” W x 6” D.
KEYPAD/DISPLAY KIT

Part No. LLD6011 (for RHPC—Press Controls)
The keypad/display kit can be used with any of the control boxes or the control module kit. This kit includes the keypad/display, an off/program/run selector switch, a light curtain off/on selector switch, a hand/foot selector switch, an inch/single/automatic selector switch, a high/low speed selector switch, a pressure/pressure distance/distance return selector switch, and 25’ of cable. Additional push buttons, nameplates, and selector switches for the motor starter, etc., can be furnished depending on the features required. Please consult the factory.

REMOTE OPERATOR STATIONS

For operator convenience, a remote operator station can be furnished for use with a plain-door standard control box, plain-door custom control box, module kit, or subpanel. The remote operator station contains the keypad/display, program selector switch, and other selector switches as required.

Remote operator stations are available in a standard format or can be customized to meet any requirements. Select from the following remote operator stations.

SELECTING AN RHPC HYDRAULIC PRESS CONTROL

To determine the 10-digit configured part number for the hydraulic press control required, follow directions 1-8 below and use the information in the PART NUMBERING SYSTEM CHART below.

1. The first 4 digits for all hydraulic press controls are RHPC.
2. The 5th digit determines the size of the disconnect switch, if provided, in the control enclosure. Zero (0) indicates no disconnect switch provided.
3. The 6th digit determines if a nonreversing motor starter is provided. Zero (0) indicates no motor starter provided.
4. The 7th digit determines the size of nonreversing motor starter that is provided in the control enclosure. Zero (0) indicates no motor starter provided.
5. The 8th digit determines the location of the operator controls, or if it is a style X, Y, or Z control without the control transformer.
6. The 9th digit is for the type of light curtain interface provided.
7. The 10th digit (if required) will indicate the type of modifier provided: i.e., motor control operators remote.

**SAMPLE**

The sample shown, RHPC-213-FW5, indicates that the custom control box is for a hydraulic press with a C4000 standard light curtain interface including an IEC 60-A disconnect switch and an IEC 25-A nonreversing motor starter. The keypad/display and all operators will be on the door of the enclosure, except for the motor controls which will be located remote.

*See page 48 for remote motor control operator stations or Safety Shields catalog.
HYDRAULIC CONTROL SYSTEMS INDIVIDUAL COMPONENTS

LINEAR CAM AND LIMIT SWITCH ASSEMBLY
Part No. CMT048
The linear cam and limit switch assembly consists of two limit switches and two adjustable cams mounted on an extruded-aluminum bracket. This assembly can provide the linear timing of the top and bottom limits of the machine cycle on a hydraulic machine.

HIGH/LOW LIMIT SWITCH ASSEMBLY
Part No. CMT049
An additional linear cam and limit switch assembly can be used for a high/low signal during the closing portion of the hydraulic stroke. This assembly consists of one limit switch and one adjustable cam mounted on an extruded-aluminum bracket.

PALM BUTTON ASSEMBLY
Part No. CTL525
Palm button assembly consists of two black run/inch buttons (with ring guards), a red emergency-stop button and a yellow return/inch-up button. Mounting boxes are furnished with each button. The electrical contact arrangement for all buttons is 1 NO and 1 NC.

FOOT SWITCH
Part No. CTD011 & CTD088
This foot switch is protected from unintentional operation. A heavy-duty die-cast cover protects the top and both sides, and the front is protected by a hinged flap. The flap must be lifted with the toe before the foot may enter the switch. The electrical contact arrangement is 1 NO and 1 NC.

PRIOR-ACTION STATION
Part No. LLD6100
This prior-action station has a push button that must be depressed and released by the operator before depressing the actuating means in order to initiate the automatic mode of operation. This NEMA 12 enclosure size is 3½” x 4½” x 3½”.

SUPERVISORY CONTROL STATION
Part No. LLD6101
Part No. LLD283 (required when a USC000 is used—see below)
When two or more palm button or foot switch operating stations are required on one machine, one supervisory control station is required at each operator station. This remote control station consists of an off/on keyed selector switch and a station on indicator light. The on position allows the operator to use that station, and the off position deactivates only that station. The enclosure size is 5¼” x 3” x 3¼”.

MULTIPLE-OPERATOR JUNCTION BOX
Part No. USC000
When multiple operator stations are required, this junction box is furnished separately for wiring up to four (4) operator stations. This junction box interfaces palm button assemblies/control bars and foot switches, and will not allow the press to run if palm buttons or a foot switch is actuated without its supervisory control station on. A lighted push button with nameplate indicates a fault condition of an operator station. The button is pushed to reset. The enclosure size is 16” x 14” x 6”.
PRESS BRAKE CONTROL SYSTEMS

INTRODUCTION
Press brakes are one of the most difficult machine tools to safeguard because of their general purpose-type use in industry. General purpose means a press brake can be used to bend from very small parts to very large parts. Production runs on these machines can be one part to thousands of parts. With this type of operation, press brakes must be versatile.

Today, with advanced technology, it is now possible for industry to safeguard press brakes and maintain the same levels of productivity when the employer (user) considers all components in the press brake system. A complete safeguarded system includes, but is not limited to, the type of press brake, the safeguard itself, tooling to be used, size, shape or configuration of workpiece, material handling, production, maintenance, and any anticipated future needs.

OSHA STANDARDS
Under OSHA, press brakes are cited for noncompliance in accordance with 29 CFR 1910.212—Machine Guarding, which specifically requires point-of-operation safeguarding. All machines fall under this same regulation where it states: “the safeguarding shall be in conformity with any appropriate standard.” Some states may have their own rules and regulations for press brakes.

ANSI STANDARDS
There are several references available on press brake safety; however, most industries use the ANSI (American National Standards Institute) B11.3 standard. This standard can be purchased by contacting:

   ANSI
   American National Standards Institute, Inc.
   25 West 43rd Street, 4th Floor
   New York, New York 10036
   (212) 642-4900
   www.ansi.org

TYPES OF PRESS BRAKES
There are two basic categories of press brakes:

   1. Part-Revolution
      Mechanical-Friction Clutch
      Air Clutch (Single- or Two-Speed)
   2. Hydraulic (Down-Acting and Up-Acting)

Each one of these press brake types is discussed on subsequent pages in this section. There are also servo-drive (electric) and hydra-mechanical press brakes that can be safeguarded. Please consult the factory.

POINT-OF-OPERATION HAZARD
Fortunately, most press brake operations do not require the operators to place their hands or any part of their body into the point-of-operation hazard; however, exposure to point-of-operation injuries still exists. Because of this exposure, the operator(s) must be safeguarded from point-of-operation hazards. Best safety practice is when operators are never required to put their hands or any part of their body in the point of operation at any time. Sometimes as the workpiece bends up, a hazard may be created between the part and the front face of the slide. When this happens, be sure the operators do not place their fingers on the top or sides of the material, but support the material from underneath.

HELPERS
Many times two or more operators are feeding and retrieving workpieces from press brake dies. The employer may describe one person as an operator and one person as a helper; however, a helper is considered an operator when exposed to any point-of-operation hazards. Each operator must be safeguarded and should have his/her own set of operating controls for cycling the machine such as palm buttons or a foot switch.
SAFEGUARDING
Press brake safeguarding can be accomplished by using one of the following safeguarding devices:
1. Presence-sensing device (Refer to Safeguarding Devices catalog)
2. Two-hand control device (Refer to this catalog)
3. Pullback device (Not offered by Rockford Systems)
4. Restraint device (Refer to Safeguarding Devices catalog)
5. Hostage control device (pp. 61-62)

PRESENCE-SENSING DEVICES
Of all the recognized point-of-operation safeguarding devices for press brakes, the light curtain is the most versatile for short- to long-run operations and for small to large workpieces. Proper use of this device provides protection for all operators and passersby in production modes of operation. It also minimizes operator resistance to using safety devices. A muting feature, most commonly used with press brakes, allows the light curtain to be bypassed during the nonhazardous portion of a press brake stroke. This is generally from ¼” or less above the workpiece to the bottom of the stroke and back to the top of the stroke. Blanking of beams or the use of float blanking are also popular options for press brake applications; however, these options must be closely supervised and discouraged whenever possible.

When applying light curtains, they must be mounted at a safe distance—refer to Safeguarding Devices catalog.
METHODS FOR CYCLING AND SETUP (CONTINUED)

HOW A LIGHT CURTAIN WORKS AS A SAFEGUARDING DEVICE ON PRESS BRAKES:

STEP 1 The operator inserts the workpiece into the press brake die and supports it either with his/her hands, on rails, or on a table.

STEP 2 The press brake is activated by a foot switch or palm buttons.

STEP 3 If the light curtain is interrupted during the die-closing portion of the cycle, the press brake slide will stop.

STEP 4 If the light curtain is not interrupted, the press brake will continue its downstroke and will either: 1) make contact with the workpiece and finish the single stroke in normal speed (or in high/low speed if chosen), or 2) stop above the workpiece if in sequence mode. In the sequence mode, the workpiece may be inserted or positioned at this time and then the slide is reactivated to finish the stroke.

Note: The light curtain is muted once the die is a maximum of ¼” above the workpiece. When the light curtain is muted, it is automatically turned off or bypassed during the bending operation to permit the workpiece or operator’s hand to move through the plane of light without interrupting the cycle.

STEP 5 The slide returns to the beginning of the cycle.

Two-hand control provides protection against point-of-operation injury during the die-closing portion of the cycle. Two-hand control is arranged so the operator(s) must hold the palm buttons depressed until the slide reaches a point ¼” or less above the workpiece. If either palm button is released, the slide stops. Both palm buttons must then be released and reactivated to finish the stroke. Two-hand control is usually arranged to provide this protection in the two-hand single-stroke, sequence, or high/low mode of operation. See information below and on the next page for additional details on how two-hand control and sequence mode of operation work.

How Two-Hand Control Works:

STEP 1 By depressing the two run buttons, the operator(s) initiate the press brake cycle.

STEP 2 The operator(s) must hold the two run buttons until the slide completes its downward travel to the workpiece or until the slide stops ¼” or less above the workpiece. If the operator(s) remove one hand from the run buttons, the slide will stop. In the single-stroke or high/low mode, the slide will make one complete cycle.

STEP 3 In the sequence mode, the slide will automatically stop at a preset position ¼” or less above the workpiece. This preset position is adjustable for different feed-line heights or material thicknesses.

STEP 4 If the workpiece is not already placed in the die, it may be inserted at this time.

STEP 5 The palm buttons or the foot switch is now reactivated, causing the slide to continue through the bottom of the cycle and automatically return at high speed to the beginning of the cycle.

Note: The controls illustrated provide the ability to inch the slide down with the palm buttons or foot switch in the single, sequence, or high/low mode of operation. By inching the slide down in these modes, the operator makes sure the upper die is going to bend the workpiece in the correct position. This also avoids hazardous whip-up action of the workpiece when inching through the workpiece bend.

TWO-HAND CONTROL DEVICES

Two-hand control, as a point-of-operation safe-guarding device for press brakes, is ideal for short-run job-shop operations. Workpieces can be from very small to very large.

Each operator station is arranged with two guarded run palm button assemblies. These buttons are usually mounted to the slide of the press brake; however, they can also be installed on a floor stand (see page 49) for more flexibility.

This illustration is of a down-acting press brake bending a workpiece with a light curtain used as the safeguard.

This illustration is of a down-acting press brake bending a workpiece with two-hand control used as the safeguard.
METHODS FOR CYCLING AND SETUP (CONTINUED)

TWO-HAND CONTROL DEVICES (CONTINUED)
The control packages offered include control reliability to minimize the possibility of an unintended stroke of the slide if there is a single component failure in the control system. The control features antirepeat, preset timing of concurrent operation of palm buttons, and nonresumption of interrupted stroke. The palm buttons must also be mounted at the proper safety distance.

When more than one operator station is required on press brakes, two palm buttons for each station must be used and must be capable of being supervised. The supervised operator stations are arranged so that if all operating stations are bypassed, the press brake will not cycle. If a foot switch is used, one is required for each operator.

When using two-hand control, the operator cannot hold onto the workpiece during the die-closing portion of the stroke. Material tables, rails, magnets on backgauges, etc., can be used to support the workpiece.

If the dies are not the exact length of the material, auxiliary safeguarding is required.

RESTRAINT DEVICE
Similar to the overhead pullback, restraints are usually applied on press brakes that perform long-run jobs. The parts being produced are usually medium size with the operator holding onto the workpiece. If small parts are being fed into the die, a hand-feeding tool must be used.

Restraints are adjusted so that an operator cannot reach into the hazardous area at any time.

Both pullbacks and restraints must be properly worn, adjusted, and maintained at all times.

PULLBACK DEVICE (NOT OFFERED BY ROCKFORD SYSTEMS)
The overhead-pullback device is usually applied on press brakes that perform long-run jobs and when small- to medium-size parts are being produced.

The pullback is a mechanical device operated from the linear motion of the slide or upper die. When adjusted properly, it pulls the operator’s hands back should they inadvertently be put into the point-of-operation hazard.

The overhead design allows the operator freedom of movement for loading and unloading workpieces without interference.

Pullbacks are designed for a fixed-length-stroke mechanical press brake; therefore, when applying them to a hydraulic press brake that may have an adjustable stroke, the stroke length will need to remain the same at all times.

HOSTAGE DEVICE
Hostage control devices are used on machines that perform short-run jobs with very large workpieces. The actuating means (hand or foot) must be protected against unintended operation and arranged so the operator(s) can never reach the point-of-operation hazard while the machine is in operation.
METHODS FOR CYCLING AND SETUP (CONTINUED)

HOSTAGE DEVICE (CONTINUED)
An example of a hostage control is a foot switch which is permanently mounted to the floor far enough away from the point of operation that the operator(s) cannot reach the point-of-operation hazard when operating the control. Two-hand control or one-hand control can be applied as well.

SAFE DISTANCE SAFEGUARDING
Safe distance safeguarding is allowable by OSHA and ANSI under certain controlled situations. Please see ANSI B11.3 for compliance guidelines. If safe distance is chosen as the primary safeguard, the control system for both mechanical and hydraulic press brakes must be control reliable. For assistance in determining your control system’s reliability, please contact Rockford Systems.

AUXILIARY SAFEGUARDING
Auxiliary safeguarding is used for additional protection from injuries for all personnel in the machine area. It is used in conjunction with primary safeguarding devices. Auxiliary safeguarding also involves the guarding of other components or hazardous openings on machines.

Auxiliary safeguards include such items as point-of-operation side barriers when light curtains are used, pressure-sensitive floor mats, workpiece tables, or horizontal light curtains. An additional set of light curtains can be used horizontally to prevent an operator or other persons from standing between the vertical plane of light and the point-of-operation hazard. To prevent unauthorized entry on the back side of the press brake, an interlocked cable and danger sign can be used (refer to Safety Shields catalog).

Danger signs, used for warning, can be mounted on the press brake slide in a position that is readily visible to the operator, setup person, or other personnel. Hand tools are another auxiliary safeguard often used when feeding and retrieving small workpieces. Hand tools by themselves are not a point-of-operation safeguarding device.

CONTROLS
Press brake controls are furnished according to the type of press brake: mechanical friction, air clutch, hydraulic, hydra-mechanical, or electric. The controls and system of the safety-related functions must be control reliable. Please see page 99 for further explanation.

ELECTRICAL LOCKOUT/TAGOUT REQUIREMENTS
A press brake requires a main power disconnect switch, and a magnetic-type motor starter for the main drive motor and the slide-adjust motor. A lockout valve is required to lock out the air power to the press brake.

COVERS
Mechanical power-transmission apparatuses of the press brake such as rotating flywheels, gears, sprockets, chains, and shafts must be covered in accordance with OSHA 1910.219, Mechanical Power-Transmission Apparatus and ANSI B15.1. All apparatuses that create a hazard up to 7’ above the floor or platform must be guarded (covered).

This is usually done by the user, either by modifying existing guards, by contacting a local sheet-metal fabricator, or refer to our Web site at www.rockfordsystems.com for mechanical motion covers.

OTHER SAFETY CONSIDERATIONS
Other areas of press brake safety must be considered in order to comply with the OSHA and ANSI standards. This includes, but is not limited to, the point-of-operation hazard exposure, when the workpiece length is less than the die length. This is a questionable area when using a light curtain or two-hand control (to the 1/4” or less point above the workpiece) as the point-of-operation safeguard. In some cases, there is an opening in the die that is larger than 1/4” on both sides of the workpiece. Common practice is to either cut or arrange all dies to be the length of the workpiece or provide barriers on the front of the press brake allowing just enough opening for the workpiece.

Another safety consideration is the proper use of front and back material-position gauges. It is important that this gauging is designed correctly so the workpiece and hand will not inadvertently slip into the hazard area. Special care must be taken with small or narrow workpieces. For example, if the backgauge is not tall enough, the workpiece could slide over it allowing the fingers and hands to be exposed to the point-of-operation hazard.

When blanking the light beam channels of a light curtain, difficulties may arise with the angle at which the workpiece is held from operator to operator. Laying the workpieces on a table or rails, or using magnets to hold workpieces made of ferrous material in position are two ways to eliminate some of the hurdles in safeguarding a press brake.

When holding onto the workpiece, good safety practice is to have the operator’s thumbs and fingers positioned alongside or underneath the workpiece—never on top.

As with all machinery, the best safety practice is to have a continuing safety program. The operator and all personnel connected with machinery must be safeguarded. The operator and die setter must be fully trained and instructed on all safety procedures and have full knowledge of the safeguarding device being used. The setup and maintenance personnel must also be trained on the proper safe operation of press brakes.
PRESS BRAKE CONTROL SYSTEMS

A press brake clutch/brake or hydraulic control system consists of:

1. A control box or light curtain interface
2a. Individual components

OR

2b. Component packages

We offer a variety of control boxes that can be furnished to meet your specific requirements. Solid-state control boxes are available as:

1. Standard clutch/brake or hydraulic control
2. Custom control which includes a fused disconnect switch and magnetic motor starter
3. Special control

SELECTING A CONTROL SYSTEM

1. To order a complete control system, determine which style control box is required.

   A standard control box, with operators on the door, includes the clutch/brake or hydraulic control only. It can also be furnished in a plain-door enclosure or as a subpanel. Both plain-door or subpanel options require a remote operator station. Subpanels are furnished without the enclosure and must be installed into an existing enclosure.

   A custom control box includes a main power disconnect switch and magnetic motor starter in the same enclosure as the clutch/brake or hydraulic control. A reversing slide-adjust motor starter may also be included.

   Special clutch/brake or hydraulic control boxes can include either a standard or custom control that requires modification for any special requirements. This can be an interface of auxiliary equipment, a light curtain interface for a non-Rockford light curtain, or components specified by the end user, such as NEMA starters and disconnects.

2. After determining the style of control box, determine the location of the operator controls, and the keypad/display. Please remember these should be installed in a convenient location for the operator. These operator controls and keypad/display can be supplied as follows:

   1. On the front of the enclosure
   2. In a remote operator station
   3. In a control bar
   4. In a console
   5. Loose for installation in an existing box
The SSC1500 solid-state control system is designed for use on press brakes. It is designed and built to comply with OSHA, ANSI B11.3 and B11.19 standards with control reliability (see page 99) and brake monitoring. It can be used on both mechanical-friction and single-speed, air-clutch press brakes.

The SSC1500 solid-state control system is designed for use on press brakes. It is designed and built to comply with OSHA, ANSI B11.3 and B11.19 standards with control reliability (see page 99) and brake monitoring. It can be used on both mechanical-friction and single-speed, air-clutch press brakes.

When this control system is furnished for mechanical-friction-clutch press brakes, it is designed to replace the mechanical foot pedal/treadle operation. A foot switch and palm buttons replace the foot pedal/treadle to actuate the press brake. It is also designed for use on single-speed and two-speed air-clutch press brakes.

This control box includes sequence stop and a light curtain interface. Two-hand control or light curtains can be used as the point-of-operation safeguard. Please see pages 59-62 for further details on safeguarding.

The control, in sequence operation, allows the operator to run the slide down at high speed, stopping just above the workpiece. When the workpiece is properly positioned in the die, the clutch is engaged and the brake is released, allowing the slide to finish the cycle or inch through the bottom of the stroke. This slow-speed action, by inching through the bottom of the stroke, avoids the fast whip-up action of the workpiece. After going through the bottom of the stroke, the slide returns normally to the top of the stroke. If necessary, the slide can also be inched down by the foot switch in the single-stroke mode. Air cylinders for engaging and disengaging the clutch and brake on mechanical-friction clutches are detailed on pages 76-77.

On single-speed air-clutch/brake press brakes, the control will either allow the slide to make a single stroke or a sequence stop stroke. On two-speed air-clutch machines, the control allows single stroke, sequence stop stroke, and high/low automatic speed change.

In many applications, a light curtain is used as the safeguard. If this is the case, it is usually mounted vertically in front of the point-of-operation hazard. The control allows the light curtain to be muted from 1/4" or less above the workpiece, through the balance of the stroke.
SSC1500 STANDARD PRESS BRAKE CONTROL (CONTINUED)

MODES OF OPERATION

- Off
- Two-hand inch (regular, timed, or top-stop)
- Two-hand single stroke
- Foot single stroke
- Sequence stop (hand/hand, hand/foot, foot/foot)
- High/low automatic speed change (for two-speed only)

FEATURES

- Meets and exceeds OSHA 1910.212, ANSI B11.3 and B11.19
- Provides two-hand control safeguarding device
- Redundant/cross-checking microprocessors
- Redundant microprocessor logic power supplies
- Redundant solenoid relays
- 4-line x 20-character LCD (liquid crystal display) with 20-key operator interface
- Wide range of input power supply—85- to 135-VAC
- Absolute resolver with sync sensor for timing and motion detection
- Time-based brake monitor with programmable warning and fault set points
- Stop-time measurement test
- Adjustable sequence stop angle
- 6 user-programmable 24-V DC static diagnostic inputs
- 2 user-programmable 24-V DC cyclic die protection inputs
- 7-digit stroke and batch counters with preset, and a 7-digit total counter
- Light curtain interface(s) with off/on selector
- Light curtain mute during the nonhazardous portion of the stroke
- 4 PLS (programmable limit switch) outputs—2 on/off angles, or 1 timed off, or 1 counted output per PLS (or 3 PLS outputs and 1 auxiliary output with 1 contact)
- For two-speed operations: 3 PLS (programmable limit switch) outputs—2 on/off angles, or 1 timed off, or 1 counted output per PLS (or 2 PLS outputs and 1 auxiliary output with 1 contact)
- Information displayed during the machine run cycle: mode of operation, strokes per minute, stop time, stroke counter, batch counter, and angle of crankshaft
- Display of text in English or Spanish

KEYPAD/DISPLAY

The keypad/display is used to enter setup information, monitor machine operation, and display messages to the user. The keypad/display has a 4-line x 20-character LCD (liquid crystal display) with 20 keys for entering information and programming. As standard, this keypad/display is mounted in the control box. For operator convenience, it can be furnished in a remote enclosure up to a maximum of 150’ from the SSC1500 control module (see page 70).

PROGRAMMABLE SETTINGS AT THE KEYPAD

The sequence-stop angle setting programs the stopping position on the downstroke for the sequence mode of operation—no manual setting of cams.

On two-speed press brakes, a low single-stroke top-stop angle can be programmed. The high/low automatic speed change is also programmable at the keypad.

DIAGNOSTICS AND FAULT MESSAGES

There are eight 24-V DC selectable current-sinking or sourcing programmable diagnostic inputs provided for the user. A fault message, input logic, and stop type can be assigned to each input from the list below. When a fault condition is detected, the machine will top stop or emergency stop, and the assigned message will be displayed. This feature helps when troubleshooting common fault conditions.

FAULT MESSAGE LIST:

- Clutch/Brake Air Fault
- Counterbalance Air Fault
- Dual Solenoid Fault
- Clutch Valve Fault*
- Brake Valve Fault*
- Lube Fault
- High Lube Pressure
- Low Lube Pressure
- Low Lube Level
- Main Motor Overload
- Ram-Adjust Motor Overload
- Lube Motor Overload
- Auxiliary Motor Overload
- Guard Interlock Open
- Front Guard Open
- Rear Guard Open

*Only used on machines that have a split clutch and brake, and two dual valves have been furnished.

**Messages typically used for die protection.

The standard SSC1500 press brake control is housed in a 20" x 20" x 8" NEMA 12 enclosure with the operators and keypad/display mounted on the front of the enclosure.
SSC1500 CUSTOM PRESS BRAKE CONTROL

Custom SSC1500 press brake control boxes are also available to fit your particular requirements. These boxes are furnished with an IEC through-the-door main power fused disconnect switch and an IEC magnetic motor starter (with push buttons). A reversing slide-adjust motor starter may also be included. They are prewired and built into a NEMA 12 enclosure.

Operator controls can be furnished on the front (F) door of the control box or on a plain (P) door with no operators except a disconnect switch. The SSC1500 custom press brake control box can be furnished in many different ways. Please refer to page 70 for the part numbering system.

If a plain door custom control or a subpanel custom control is required, a remote operator station is needed. See ordering information on page 69.

NEMA-style disconnect switches and motor starters, and brand name components specified by our customers are also available.

To ensure the starter(s) and disconnect are sized properly, please check horsepower for the main drive motor and slide adjust motor (if furnished) on the press brake, as well as full-load amps, and primary voltage to the press brake. After obtaining this information, please go to the chart on page 70 to determine the proper custom control box part number. Follow directions 1-6 to obtain the correct part number of the control box.

Example of the part numbering system: The press brake requires a C4000 advanced light curtain interface, a 60-A disconnect switch, a reversing 25-A reversing main motor starter, and a 12-A reversing ram adjust motor starter. All operators will be located on the door of the enclosure except the ram adjust motor control which will be located remote. The part number to order would be PRS263-FC6.
SSC1500 REMOTE OPERATOR-STYLE CONTROL BOXES FOR PRESS BRAKES

These remote operator-style clutch/brake control boxes include the same features and modes of operation as the standard SSC1500 control boxes described on pages 64-65. However, they do not have a control transformer. These control boxes are designed to be located on the front of the machine near the operator.

These controls are for applications where the machine’s existing magnetic motor starter, fused disconnect switch, and control transformer meet the safety requirements and can be reused. If the existing control transformer cannot be reused or a new control transformer is required, please contact the factory.

The three remote operator-style control boxes available have the keypad/display and all operators on the door of the 20” x 20” x 8” NEMA 12 enclosure. Please see the next page for the three styles available.
Style X Includes:
- Keypad/display
- Program/run/off selector switch
- Mode selector switch
- Actuating means selector switch
- Light curtain off/on selector switch
- Internal clutch/brake control module, master control relay, and terminals

Style Y Includes:
- Keypad/display
- Program/run/off selector switch
- Mode selector switch
- Actuating means selector switch
- Light curtain off/on selector switch
- Internal clutch/brake control module, master control relay, and terminals
- Self-latching emergency-stop button

Style Z Includes:
- Keypad/display
- Program off/on selector switch
- Mode selector switch
- Actuating means selector switch
- Light curtain off/on selector switch
- Internal clutch/brake control module, master control relay, and terminals
- Self-latching emergency-stop button
- Two guarded run/inch buttons located on the sides of the enclosure
CONTROL MODULE KIT

Part No. PRS000-KB (for SSC1500 PRS Controls)
Part No. PRT000-KB (for SSC1500 PRT Controls)

A control module kit allows the end user to update the clutch/brake control of a press brake with minimum equipment costs. The kit is supplied without the control enclosure, panel, control transformer, control fuse, terminal strips, wire duct, and wiring.

This control module kit includes the control module, master control relay, shock mounts, fasteners, suppressors, danger labels, and electrical prints. A keypad/display kit is required unless a remote operator station is used (see below).

A set of electrical prints is supplied to show typical wiring and all mounting dimensions are provided in order for a qualified person to install the control module kit. The minimum area required on an existing control panel to install this kit is 18” H x 18” W x 6” D.

KEYPAD/DISPLAY KIT

Part No. LLD1519G2 (for SSC1500 PRS Controls)
Part No. LLD1545G2 (for SSC1500 PRT Controls)

The keypad/display kit can be used with any of the control boxes or the control module kit. This kit includes the keypad/display, a screen label, a program off/on selector switch, a light curtain off/on selector switch, a hand, hand/foot, foot selector switch, an off/inch/single/sequence stop selector switch, and 25’ of cable. Additional push buttons, nameplates, and selector switches for motor starters, etc., can be furnished depending on the features required.

A resolver/pulser assembly and cable, Part No. CMS115, is required with any of the control selections. See page 77 for further details on this component.

REMOTE OPERATOR STATIONS

For operator convenience, a remote operator station can be furnished for use with a plain-door standard control box, plain-door custom control box, or control module kit. The remote operator station contains the keypad/display, program off/on selector switch, and other selector switches and push buttons as required.

Remote operator stations are available in a standard format or can be customized to meet any requirements. Select from the following remote operator stations or contact the factory with your special requirements.

If any of the above remote operator stations are required without the enclosure, please consult the factory.
SELECTING AN SSC1500 PRESS BRAKE CONTROL

To determine the 8- or 9-digit configured part number for the press brake control required, follow directions 1-6 below and use the information in the PART NUMBERING SYSTEM CHART below.

1. The first 3 digits for all SSC1500 press brake controls are PRS or PRT.
2. The 4th digit determines the size of the disconnect switch, if provided, in the control enclosure. Zero (0) indicates no disconnect switch provided.
3. The 5th and 6th digits determine the size and type of motor starter(s), if provided, in the control enclosure. Zeros (00) on both positions indicate no motor starter(s) provided.
4. The 7th digit determines the location of the operator controls, or if it is a style X, Y, or Z control without the control transformer.
5. The 8th digit is for the type of light curtain interface provided.
6. The 9th digit (if required) will indicate the type of modifier provided: i.e., motor control operators remote.

**SAMPLE**

PRS - 2 - 63 - F C - 6

The sample shown, PRS263-FC6, indicates that the custom part-revolution control box with sequence stop mode of operation will contain a C4000 advanced light curtain interface, an IEC 60-A disconnect switch, an IEC 25-A reversing main drive motor starter, and an IEC 12-A reversing ram-adjust motor starter. The keypad/display and all operators will be located on the door of the enclosure, except for the ram-adjust motor controls which will be located remote.
An absolute resolver/pulser cycle timing device is required to provide the angular position and velocity/motion information of the machine crankshaft to the control. The resolver is a highly accurate and repeatable device which uses an internally mounted pulser cam and disk to verify the position of the crankshaft.

The resolver/pulser timing device is contained in a rugged, heavy-duty housing with a spring-compression base. The spring base helps isolate the resolver from shock load and vibration that are common occurrences on press brakes. This provides longer life for the components inside the resolver. The spring base also functions as a drive chain tightener.

This resolver allows the setup person to make all cycle timing adjustments with the keypad/display. These adjustments include sequence set point, mute set point, and high/low speed change.

The 3/4” diameter steel drive shaft is mounted in sealed ball bearings. The resolver/pulser is furnished with a 40’ cable (or optional 100’ cable) that is connected to the drive assembly and wires into the control box. The cable can be cut to length and wired to terminals.

A sprocket set consists of two 1:1 sprockets. One fits on the 3/4” shaft of the CMS115 resolver/pulser assembly; the other sprocket is for mounting to the end of the press brake crankshaft to rotate the cycle timing device. These 48-tooth sprockets are designed to accept ANSI No. 35 roller chain.

If your machine does not have access to the crankshaft to provide 1:1 ratio drive for the resolver/pulser assembly, special sprocket sets are available to match the gear drive ratio of the machine. The smaller of the two sprockets is attached to the drive of the machine (usually on the backshaft) and the larger sprocket is attached to the resolver/pulser assembly. Please provide the gear ratio of the press brake when ordering these special sprockets along with the brand name and serial number of the press brake.

ANSI No. 35 roller chain and master link is 10 feet long for driving any of the above sprockets.

*Included in component package on page 74.
SSC1500 INDIVIDUAL COMPONENTS (CONTINUED)

MONITORED DUAL-SOLENOID AIR VALVE

1/2" Port—Part No. RCL652* for Mechanical-Friction Clutch

This three-way cross flow, series/parallel air valve includes an air pressure electrical output monitor and muffler. Air is put into the clutch and brake when the dual-solenoid air valve is electrically energized. When it is de-energized, the air is dumped through the muffler from the clutch and brake.

This valve consists of two main parts: the piloted monitor assembly and the valve body assembly. The two main valve elements move simultaneously during normal operation. If these elements should fail to move simultaneously, the internal spool shifts, inhibiting further machine operation. The pressure switch will provide a signal to the control system to indicate a fault condition. A reset button on the side of the valve can be used to reset the valve if an accidental valve fault is detected.

1/2" FILTER-REGULATOR-LUBRICATOR ASSEMBLY (FRL)
Part No. RCL044* for Mechanical-Friction Clutch

This assembly is required to meet OSHA and ANSI standards. This FRL assembly filters, regulates, and lubricates the air going through it. This filtered and lubricated air then goes to the dual-solenoid air valve assembly and clutch/brake. The regulator should be adjusted to meet the original equipment manufacturer’s requirements. The assembly includes a gauge, coupling, and a steel mounting bracket.

AIR PRESSURE SWITCH—Part No. CTD062*

This air pressure switch monitors low pressure to either the clutch/brake-actuating air cylinder and valve or slide counterbalance systems. Each system requires an air pressure switch. The pressure switch must be set so if the air pressure operating the component is not adequate, or if the air pressure suddenly drops, the press brake becomes inoperable.

This switch is used on applications where the air pressure should not go below a predetermined amount. Each air pressure switch’s low level setting is based on each application.

Note: When press brakes have an air counterbalance system, an air pressure switch and check valve are required. See page 30 for a check valve.

PALM BUTTON ASSEMBLY

To meet OSHA and ANSI safety requirements, the two run/inch buttons must be protected against accidental operation (ring guards) and separated to require the use of both hands to operate them. They must also be mounted at the proper safety distance, if they will be used as a safeguard. The contact arrangement of these buttons is 1 NO and 1 NC.

Part No. CTL507*

This palm button assembly consists of two black run/inch buttons (with ring guards) and a red emergency-stop button. Mounting boxes are furnished with each button. The red palm button has 1 NO and 1 NC arrangement plus a mechanical latch.

See pages 89-90 for other palm button assembly options. See page 49 for control bars.

*Included in a component package on page 74.
FOOT SWITCH—Part No. CTD011* & CTD088
This foot switch is protected from unintentional operation. A die-cast cover protects the top and both sides, and the front is protected by a hinged flap. The flap must be lifted with the toe before the foot may enter the switch. The electrical contact arrangement is 1 NO and 1 NC.

SUPERVISORY CONTROL STATION
Part No. LLD1501
Part No. LLD283* (required when a USC000 is used—see below)
When multiple operator stations are required, this supervisory control station is furnished separately for each set of palm buttons and/or foot switch operator station. It has its own enclosure and includes an off/on key-operated selector switch and a green on indicator light. The enclosure size is 3½” x 6¾” x 3”.

MULTIPLE-OPERATOR JUNCTION BOX—Part No. USC000*
When multiple operator stations are required, this junction box is furnished separately for wiring up to four (4) operator stations. This junction box interfaces palm button assemblies/control bars and foot switches, and will not allow the press brake to run if palm buttons or a foot switch is actuated without its supervisory control station on. A lighted push button with nameplate indicates a fault condition of an operator station. The button is pushed to reset. The enclosure size is 16” x 14” x 6”.

CRANKSHAFT ANGLE DISPLAY
Part No. FTL055
The optional crankshaft angle display is a unit that shows the angular position of the crankshaft for mechanical press brakes. The crankshaft position is shown both graphically (with red LEDs in a circle) and numerically (with a large, red, three-digit LED). The large display can be easily seen which helps with setup, removal of stuck workpieces, or for assistance during emergency extractions procedures.

FEATURES
• Large LED numerical display and circular LED graphic display can be easily seen
• Mounts easily
• Supplied with 25’ of cable for connection to the control
• Helps satisfy the requirements of Canadian Standard CSA Z142-02, Code for Power Press Operation: Health, Safety, and Guarding Requirements, for indication of crank angle position

*Included in a component package on page 74.
COMPONENT PACKAGE FOR MECHANICAL-FRICTION-CLUTCH PRESS BRAKES ONLY

To complete the SSC1500 control system for mechanical-friction-clutch press brakes, component packages are available. If component packages for air clutch press brakes are required, please see page 78. Component packages are listed in the chart below. These packages can be furnished with:

- **A STANDARD** Control (pp. 64-65)
- **A CUSTOM** Control (p. 66)
- **A REMOTE OPERATOR-STYLE** Control (pp. 67-68)
- **A SPECIAL** Control (p. 66)
- **A SUBPANEL**

To select the proper component package to go with your control box, determine your requirements below:

A Modes of operation and actuating means required.
B Number of operator stations required.
C Type of sprockets required.

### Modes of operation: Inch, Single, and Sequence Stop (Hand or Foot)

Note: If the press brake has an air counterbalance, an additional CTD062 air pressure switch is required.

Please select an air cylinder from page 75 or 76 to complete this package. For light curtains, mounting brackets and barriers for sides of point of operation, see Safeguarding Devices catalog.
RCL SERIES AIR CYLINDERS

An air cylinder must be ordered separately for mechanical-friction-clutch press brakes that are using the packages described on page 74. It is required to complete the control system. Standard air cylinders are single-acting, pull-type, and spring return. A clevis mounting arrangement is furnished for attaching the cylinder to the machine frame. A rod, yoke, and pin assembly are used for ease in connecting to the existing clutch/brake operating rod. Other types of air cylinders are also available. Before ordering an air cylinder, please check the linkage where the cylinder will be inserted for proper stroke and diameter of air cylinder needed. Please consult the factory for any special requirements, such as push-type cylinders or longer- or shorter-stroke cylinders.

Part No. RCL004—Air Cylinder
300-lb pull @ 75 PSI, 21/2" bore x 2" stroke for press brake sizes up to 8’ beds. (Cylinders with longer or shorter strokes, and push cylinders are available upon request.)

Part No. RCL005—Air Cylinder
500-lb pull @ 75 PSI, 31/4" bore x 2" stroke for press brake sizes 10’ to 14’ beds. (Cylinders with longer or shorter strokes, and push cylinders are available upon request.)

Note: Please see the next page for special tie-rod-constructed air cylinders (for larger press brakes) or special mounting features.

MASTER CYLINDER-OPERATED PRESS BRAKES (OLDER WYSONG PRESS BRAKES)
Press brakes that use a master cylinder-type hydraulic system to operate a mechanical-friction clutch and brake can be retrofitted with the controls illustrated in this catalog. The following illustration shows how the air cylinder that operates the clutch and brake can be applied.

FOOT SWITCH PACKAGE
For control systems on pages 64-74, the RCL004 air cylinder can be applied as illustrated below.
OTHER AIR CYLINDERS AVAILABLE

The following custom tie-rod-constructed air cylinders can be furnished instead of the standard RCL series cylinders offered on the previous page. These cylinders are furnished when a larger and more durable cylinder is needed to engage and disengage the mechanical-friction clutch and brake of press brakes or when the clevis mount will not fit the machine. Please note that they are offered in tie-rod construction, both pull-type and push-type, single action with spring return. The push type has an internal spring. All cylinders are furnished with yoke and pin on the operating rod to attach to the machine linkage.

When applying an air cylinder to the machine, make sure the alignment (with the machine linkage) is a straight line. Also make sure the cylinder rod, yoke, or any moving parts will not bind after installation. Be sure the rod stroke is not too long—it could cause jackknifing of the cylinder and clutch operating rod. Please consult the factory for any other special cylinder configuration (i.e., longer or shorter stroke) or additional force needed on the return spring.

TYPE A—CLEVIS MOUNT

This air cylinder is usually mounted in the vertical position on the side of the machine.

---

TYPE B—SIDE-FOOT MOUNT

This air cylinder can be mounted vertically, horizontally, or any angle depending upon application.

SINGLE- AND TWO-SPEED AIR-CLUTCH PRESS BRAKES

INTRODUCTION

Air-operated clutches and brakes use a friction arrangement that causes engagement and disengagement. When air pressure enters the clutch and brake, through a monitored dual-solenoid air valve, the clutch engages and the brake is released. To stop the motion of the press brake, the opposite takes place.

Some press brakes have one clutch that allows only one speed when cycling the machine while other press brakes have two clutches for two speeds. Two-speed air-clutch press brakes allow the slide to approach the workpiece at a fast speed, disengage (air is dumped from one clutch), then allow the second clutch to engage for a slower speed through the bending operation to the bottom of the stroke. This prevents fast whip-up action of the material. The clutches are again switched for rapid travel back to the top of the stroke.

If these types of machines are newer, they do not always require a completely new clutch/brake control package for control reliability. To verify this, please send the electrical schematics to our engineering department for review. These schematics are also necessary to review for proper interface when a light curtain will be furnished. If a single- or two-speed air-clutch press brake doesn’t have control reliability and when brake monitoring is needed, the SSC1500 control can be furnished.

SELECTING A CONTROL SYSTEM FOR PART-REVOlUTION-AIR-CLUTCH PRESS BRAKES

1. Determine if the press brake is a single- or two-speed press brake (one or two clutches).

2. If the press brake is a single-speed and sequence-stop operation is required, the SSC1500 control on pages 64–74 can be used. Select a component package from page 66. Light curtains, mounting brackets, and lockout valves are not part of the component packages and must be ordered separately. Please see page 33 for an appropriate lockout valve and Safeguarding Devices catalog for light curtain options and mounting brackets.

3. If the press brake has a two-speed air clutch, the standard SSC1500 control on pages 64–74 can be used. Select the component package from page 74. Light curtains mounting brackets (Safeguarding Devices catalog), and lockout valves (page 33) are not part of the component packages and must be ordered separately.

Notes: See Safety Shields catalog for safeguarding the back side of the press brake.
COMPONENT PACKAGES FOR SINGLE- AND TWO-SPEED AIR-CLUTCH PRESS BRAKES

To complete the SSC1500 single- and two-speed air clutch press brake control system, component packages are available. Component packages are listed in the charts below. These packages can be furnished with:

- **A STANDARD Control** (pp. 64-65)
- **A CUSTOM Control** (p. 66)
- **A SPECIAL Control** (p. 66)
- **A REMOTE OPERATOR-STYLE Control** (pp. 67-68)
- **A CONTROL CONSOLE**
- **A SUBPANEL**

To select the proper component package to go with your control box, determine your requirements below:

A. Modes of operation and initiating means required.
B. Number of operator stations required.
C. Type of sprockets required.

### Modes of operation: Inch, Single, and Sequence Stop (Hand or Foot)

### Notes:

- If the press brake has an air counterbalance, an additional CTD062 air pressure switch is required.
HYDRAULIC PRESS BRAKE CONTROL SYSTEMS

INTRODUCTION
Each hydraulic press brake must be looked at as an individual system. This system consists of, but is not limited to, the machine frame, all mechanical parts, hydraulic system, electrical or electronic systems, pneumatic systems, tooling or dies (present and future), tool or die setup, safeguarding, material handling, size or configuration of workpiece, maintenance requirements, and most importantly, production requirements.

In ANSI B11.3, subclause 6.2 Performance of the Safety-Related Functions, it states that “The control system shall meet the requirements of 8.3.”

8.3 PERFORMANCE OF THE SAFETY-RELATED FUNCTION(S)
When a component, module, device or system failure occurs, such that it or a subsequent failure of another component, module, device or system would lead to the inability of the safety-related function(s) to respond to a normal stop command or an immediate stop command, the safety-related function shall:

a) prevent initiation of hazardous machine motion (or situation) until the failure is corrected or until the control system is manually reset; or

b) initiate an immediate stop command and prevent reinitiation of hazardous machine motion (or situation) until the failure is corrected or until the control system is manually reset; or

c) prevent re-initiation of hazardous machine motion (or situation) at the next normal stop command until the failure is corrected or until the control system is manually reset.

6.14.5 HYDRAULIC COMPONENTS AND CIRCUITS
Hydraulic components and circuits that control ram motion shall comply with the requirements of 6.2 (and 8.3).

CONTROLS
The controls described in this catalog include two-hand control as a point-of-operation safeguarding device. The palm buttons must be depressed concurrently and maintained during the hazardous downstroke of the ram. Release of one or both palm buttons reverses or stops the action of the ram. The controls offered also include a light curtain interface.

ELECTRICAL REQUIREMENTS
The ANSI B11.3 standard requires a proper main power disconnect switch. A motor starter is also required that drops out when power is lost and will not restart automatically. All AC control circuits and solenoid valves must be powered by 120 V or less (obtained from the transformer), and the control system must be protected against false operation due to an accidental ground. Refer to subclause 6.1.

UPDATING HYDRAULIC PRESS BRAKES
To update the electrical system or to add point-of-operation safeguarding to a hydraulic press brake, the electrical and hydraulic schematic diagrams must be reviewed by Rockford Systems’ engineering department. Please provide these schematics to our sales personnel or factory-authorized representatives when they visit your plant to conduct a machine survey.
STANDARD HYDRAULIC PRESS BRAKE CONTROL

This solid-state control system is designed for use on hydraulic press brakes. It is designed and built to comply with OSHA 29 CFR 1910.212, ANSI B11.3 and B11.19. This control can update or replace existing control systems on hydraulic press brakes found in users’ plants or can be furnished for new or rebuilt hydraulic press brakes.

This control includes control reliability, two-hand control, light curtain interface, and diagnostics (two user-programmable inputs). It also includes batch and stroke counters with presets, and a hard-wired emergency-stop master control relay.

This is an economic, full-featured dual micro-processor-based control system. The system uses redundant inputs from devices such as palm buttons, foot switches, and light curtain(s). The system output to the solenoid valves is provided by two force-guided relays. These output relays are independently controlled and cross-checked by the microprocessors. This allows control-reliable operation of the outputs in the event of a single control component failure in the control. The standard hydraulic press brake control has minimum requirements for the press brake it is to control. These minimum requirements include a directional or one up and one down solenoid valve(s) for the ram, a TOS (top-of-stroke) limit switch, and a BOS (bottom-of-stroke) limit or pressure switch. In most cases, if these already exist, they can be reused. Speed-change valves and limit switches can also be supported with the standard hydraulic control. If other valves exist (additional speed change valves, prefill, regeneration, level, bypass, etc.), please consult the factory for a quote on a special-designed control.

The standard control box is a 20” x 20” x 8” NEMA 12 enclosure with the operator controls and keypad/display mounted in the door, as shown.

A starter or disconnect can be included in a larger enclosure, or a combination starter disconnect can be furnished separately.
STANDARD HYDRAULIC PRESS BRAKE CONTROL (CONTINUED)

OPERATOR INTERFACE KEYPAD/DISPLAY
The operator interface keypad/display is used to enter setup information, monitor machine operation, and display messages on a 4-line x 20-character LCD (liquid crystal display). As standard, this keypad is mounted on the control box door. For operator convenience, it can be installed in a remote operator station. Programming is accessed by a keyed selector switch.

PROGRAMMING
The hydraulic press brake control can be quickly and easily programmed. There are up to two 24-V DC selectable current sinking or sourcing programmable diagnostic inputs provided for the user. A fault message, input logic, and stop type can be assigned to each input from the list shown. When a fault condition is detected, the machine will stop or emergency stop, and the assigned message will be displayed. This feature helps when troubleshooting common fault conditions.

MODES OF OPERATION
• Off
• Two-hand inch
• Two-hand single stroke
• Foot single stroke
• Foot switch trip or one-hand trip single stroke (used in conjunction with a point-of-operation safeguard)*
• High, high/low, low speed change
• Sequence stop (hand/hand, hand/foot, foot/foot)

*Additional components may be required to use this mode of operation.

FEATURES
• Meets and exceeds OSHA 29 CFR 1910.212, ANSI B11.3 and B11.19
• Provides two-hand control safeguarding device
• Redundant and cross-checking microprocessors
• Redundant switching style DC power supplies
• Two monitored ram advance (up or down) 24-V force-guided output relays
• External relay monitoring (for use when external relays are used to energize the down valves)
• Blocking valve monitoring
• Press control operates on 85-135 VAC
• Provisions for optional light curtain interface with off/on supervised keyed selector switch
• Easy to read back-lit liquid crystal operator interface display having 4 lines x 20 characters
• Two (2) 24-V DC digital user inputs, programmable, selectable canned messages
• One (1) ram speed change (fast-slow) output, standard 120 VAC with a selector switch for high, high/low, low speed (to support machines with a speed change solenoid valve)
• One (1) ram return (up or down) output, standard 120 VAC with a selector switch for pressure, pressure/distance, distance return
• Bottom dwell timer (0-600 seconds)
• Decompression timer (50-250 ms)
• 7-digit stroke counter
• 7-digit batch counter with preset
• Operator interface keypad and display, text in English or Spanish
CUSTOM HYDRAULIC PRESS BRAKE CONTROL

A custom control box contains the standard control module and components described on pages 80-81 plus the following:

- main power disconnect switch
- main hydraulic pump motor starter

The box will vary in size based on the disconnect switch and motor starter components. The box is furnished with an IEC through-the-door main power fused disconnect switch and an IEC hydraulic pump magnetic motor starter (with push buttons). They are prewired and built into a NEMA 12 enclosure.

Operator controls and the keypad/display are located on the front of the door, or a plain-door control or subpanel can be furnished. A remote operator station or keypad/display kit is required if a plain-door control or subpanel is ordered. See page 83 for information on remote operator stations.

To ensure the starter(s) and disconnect are sized properly, please check horsepower for the main drive motor and slide adjust motor (if furnished) on the machine, as well as full-load amps, and primary voltage to the machine. After obtaining this information, go to the chart on page 83 to determine the proper custom control box part number. Follow directions 1-7 to determine the correct part number.

REMOTE OPERATOR-STYLE CONTROL BOXES

Remote operator-style X, Y, and Z hydraulic control boxes include the same features and modes of operation as the standard hydraulic control boxes. However, they do not have a control transformer. These control boxes are designed to be located on the front of the machine near the operator.

These controls are for applications where the machine's existing magnetic motor starter, fused disconnect switch, and control transformer meet the safety requirements and can be reused. If the existing control transformer cannot be reused or a new one is required, please contact the factory.

The keypad/display and all operator controls are located on the door (front) of the remote operator-style control box.

CONTROL MODULE KIT

A control module kit allows the end user to update the hydraulic control of a press brake with minimum equipment costs. The kit is supplied without the control enclosure, panel, control transformer, control fuse, terminal strips, wire duct, and wiring.

A set of electrical prints is supplied to show typical wiring, and all mounting dimensions are provided in order for a qualified person to install the control module kit. The minimum area required on an existing control panel to install this kit is 18" H x 18" W x 6" D.

This control module kit includes the control module, control relays, shock mounts, fasteners, suppressors, danger labels, and electrical prints. A keypad/display kit is required unless a remote operator station is used (see next page).

SUBPANEL

A subpanel control can also be furnished. It is the same as the standard control described on pages 89-90 without the enclosure. The minimum area required in an existing control enclosure is 181/2" H x 181/2" W x 6" D.
KEYPAD/DISPLAY KIT

Part No. LLD6025

The keypad/display kit can be used with any of the control boxes or the control module kit. This kit includes the keypad/display, an off/program/run selector switch, a light curtain off/on selector switch, a hand/foot selector switch, an inch/single/sequence stop selector switch, a high/low speed selector switch, a pressure/pressure distance/distance return selector switch, and 25’ of cable. Additional push buttons, nameplates, and selector switches for the motor starter, etc., can be furnished depending on the features required. Please consult the factory.

REMOTE OPERATOR STATIONS

For operator convenience, a remote operator station can be furnished for use with a plain-door standard control box, plain-door custom control box, module kit, or subpanel. The remote operator station contains the keypad/display, program selector switch, and other selector switches as required.

Remote operator stations are available in a standard format or can be customized to meet any requirements. Select from the following remote operator stations.

SELECTING AN RHPS HYDRAULIC PRESS BRAKE CONTROL

To determine the 10-digit configured part number for the hydraulic press brake control required, follow directions 1-7 below and use the information in the PART NUMBERING SYSTEM CHART below.

1. The first 4 digits for all hydraulic press brake controls are RHPS.
2. The 5th digit determines the size of the disconnect switch, if provided, in the control enclosure. Zero (0) indicates no disconnect switch provided.
3. The 6th digit determines if a nonreversing motor starter is provided. Zero (0) indicates no motor starter provided.
4. The 7th digit determines the size of nonreversing motor starter that is provided in the control enclosure. Zero (0) indicates no motor starter provided.
5. The 8th digit determines the location of the operator controls, or if it is a style X, Y, or Z control without the control transformer.
6. The 9th digit is for the type of light curtain interface provided.
7. The 10th digit (if required) will indicate the type of modifier provided: i.e., motor control operators remote.

The sample shown, RHPS-315-PW5, indicates that the custom control box is for a hydraulic press brake that has a plain door box with a C4000 standard light curtain interface including an IEC 100-A disconnect switch and an IEC 40-A nonreversing motor starter. The keypad/display and all operators including the motor controls will be located remote (see page 91).

*See page 48 for remote motor control operator stations or Safety Shields catalog.
HYDRAULIC CONTROL SYSTEMS INDIVIDUAL COMPONENTS

LINEAR CAM AND LIMIT SWITCH ASSEMBLY
Part No. CMT048
The linear cam and limit switch assembly consists of two limit switches and two adjustable cams mounted on an extruded-aluminum bracket. This assembly can provide the linear timing of the top and bottom limits of the machine cycle on a hydraulic machine.

HIGH/LOW LIMIT SWITCH ASSEMBLY
Part No. CMT049
An additional linear cam and limit switch assembly can be used for a high/low signal during the closing portion of the hydraulic stroke. This assembly consists of one limit switch and one adjustable cam mounted on an extruded-aluminum bracket.

PALM BUTTON ASSEMBLY
Part No. CTL525
Palm button assembly consists of two black run/inch buttons (with ring guards), a red emergency-stop button and a yellow return/inch-up button. Mounting boxes are furnished with each button. The electrical contact arrangement for all buttons is 1 NO and 1 NC.

FOOT SWITCH
Part No. CTD011 & CTD088
This foot switch is protected from unintentional operation. A heavy-duty die-cast cover protects the top and both sides, and the front is protected by a hinged flap. The flap must be lifted with the toe before the foot may enter the switch. The electrical contact arrangement is 1 NO and 1 NC.

SUPERVISORY CONTROL STATION
Part No. LLD6101
Part No. LLD283 (required when a USC000 is used—see below)
When two or more palm button or foot switch operating stations are required on one machine, one supervisory control station is required at each operator station. This remote control station consists of an off/on keyed selector switch and a station on indicator light. The on position allows the operator to use that station, and the off position deactivates only that station. The enclosure size is 5¼” x 3” x 3¼”

MULTIPLE-OPERATOR JUNCTION BOX
Part No. USC000
When multiple operator stations are required, this junction box is furnished separately for wiring up to four (4) operator stations. This junction box interfaces palm button assemblies/control bars and foot switches, and will not allow the press to run if palm buttons or a foot switch is actuated without its supervisory control station on. A lighted push button with nameplate indicates a fault condition of an operator station. The button is pushed to reset. The enclosure size is 16” x 14” x 6”.
SPRING-LOADED TURNOVER BARS

In OSHA 29 CFR 1910.217, it says that “The employer shall provide spring-loaded turnover bars for presses designed to accept such turnover bars.” The turnover bar is most frequently used with mechanical power presses. Turnover bars can also be used on four-slides or any other machine where the bar might be sent into the air if it is inadvertently left in the bar ring hole and the machine is turned on. Each spring-loaded turnover bar is self-ejecting so it can’t be left in the bar hole.

*Each engaging bar is made .010" under corresponding hole size. End is chamfered for easy entry. Consult the factory for special sizes.*
OPTIONAL PALM BUTTON ASSEMBLIES

Other styles of palm buttons are available to meet the OSHA and ANSI safety standards. The following pages include options to our standard palm buttons listed throughout this catalog.

All palm buttons can be furnished:

- as individual palm buttons
- in sets of two with ring guards for two-hand trip or two-hand control
- in control bars, special boxes, or control consoles

Ring guards, covers, or similar devices must protect the palm button from accidental activation. Anti tie-down protection is required for single-stroke, two-hand trip, and two-hand control. It should already be built into the control system where any of these assemblies are applied. The buttons must also be mounted at a proper safety distance according to OSHA 29 CFR 1910.217 for two-hand trip or two-hand control when applying them to mechanical power presses. ANSI also requires that they be at the calculated safety distance on many other machines.

The assemblies, which include the ring guard and mounting plate, provide protection against unintended operation. All emergency-stop buttons are latch-out type buttons.

LIGHT-PUSH PALM BUTTONS

These light-push palm button assemblies can replace the standard black palm button assemblies (shown throughout this catalog) when a lighter push is required.

The run/inch palm buttons have a single plunger which provides 1 NO and 1 NC contact arrangement. The mushroom head is made of a zinc die cast and has a flat plunger. The palm button cover plate has a solid neoprene gasket which provides an oil-tight seal upon installation.

ORDERING INFORMATION

Part No. CTL533—Two chrome run/inch buttons, ring guards, and red emergency-stop palm button. The red palm button has 1 NO and 1 NC contact arrangement.

Part No. CTL534—Two chrome run/inch buttons, ring guards, red emergency-stop palm button, and yellow top-stop palm button. The red and yellow palm button each have 1 NO and 1 NC contact arrangement.

Part No. CTL538—Two chrome run/inch buttons, ring guards, red emergency-stop palm button, and yellow return/inch-up palm button. The red and yellow palm button each have 1 NO and 1 NC contact arrangement.
ARTICULATED PALM BUTTONS
These palm button assemblies have articulated chrome palm buttons and are offered in 24-V DC low-voltage or 115VAC standard-voltage contacts. The low-voltage buttons are specifically designed for use with solid-state controls only and should not be used with relay-based controls. These ergonomic, heavy-duty palm buttons can be operated at any angle and are easy to push. The buttons are chrome plated and the guards are made of steel. The buttons provide 1 NO and 1 NC contact arrangement.

STANDARD-VOLTAGE CONTACT RATINGS
Maximum Voltage .............................................................. 600 VAC/DC
Typical Operating Force ........................................ 3.7 lb (center), 2.7 lb (perim.)

LOW-VOLTAGE CONTACT RATINGS
Minimum Voltage DC .............................................................. 5 V, 1 mA
Maximum Voltage DC ........................................................... 48 V, 0.1 A
Maximum Voltage AC .......................................................... 240 V, 0.4 A
Typical Operating Force ........................................ 3.7 lb (center), 2.7 lb (perim.)

ORDERING INFORMATION
STANDARD-VOLTAGE CONTACTS—115VAC
Part No. CTL547—Two articulated chrome run/inch buttons with ring guards, mounting boxes, and red emergency-stop palm button.
Part No. CTL548—Two articulated chrome run/inch buttons with ring guards, mounting boxes, red emergency-stop palm button, and yellow top-stop palm button.
Part No. CTL550—Two articulated chrome run/inch buttons with ring guards, mounting boxes, red emergency-stop palm button, and yellow return/inch-up palm button.

LOW-VOLTAGE CONTACTS—24 V DC
Part No. CTL541—Two articulated chrome run/inch buttons with ring guards, mounting boxes, and red emergency-stop palm button.
Part No. CTL542—Two articulated chrome run/inch buttons with ring guards, mounting boxes, red emergency-stop palm button, and yellow top-stop palm button.
Part No. CTL544—Two articulated chrome run/inch buttons with ring guards, mounting boxes, red emergency-stop palm button, and yellow return/inch-up palm button.
REPLACEMENT PARTS FOR PALM BUTTON ASSEMBLIES

Universal Run Button RING Guard  
Part No. CTK006  
This palm button ring guard is the way to protect new and existing run palm buttons from accidental operation. This high-impact PVC plastic palm button ring guard can be used with most palm button brands. The large square ring shape allows the operator to change hand position as well as use other surfaces of the hand to cycle the machine. This ring guard resists deterioration that can occur from cutting oils and other types of lubricants that come in contact with it. This ring guard has a relief for the wrist, and the word run is molded into the top of the ring guard. Four 1¼” screws are furnished with each ring guard.

CHROME PALM BUTTON  
Part No. CTC737  
This heavy-duty, light-push, single plunger run/inch palm button provides 1 NO and 1 NC contact arrangement. This 2¼” button is constructed of zinc cast and has a flat plunger. The palm button cover plate has a solid neoprene gasket which provides an oil-tight seal upon installation. This palm button can replace the black palm button described below when a lighter push is required. The force required to operate this button is 2.5 lb.

ARTICULATED CHROME PALM BUTTON WITH GUARD  
Part No. CTC746—Standard Voltage  
Part No. CTC751—Low Voltage  
This ergonomic, heavy-duty palm button provides 1 NO and 1 NC contact arrangement. The palm button is chrome plated and the guard is made of steel. The straight-push force required to operate this button is 3.7 lb.

BLACK PALM BUTTON  
Part No. CTC726  
This standard heavy-duty, single plunger run/inch palm button provides 1 NO and 1 NC contact arrangement. This 2¼” button is mushroom shaped. The palm button cover plate has a solid neoprene gasket which provides an oil-tight seal upon installation. The force required to operate this button is 5 lb.

YELLOW TOP-STOP PALM BUTTON  
Part No. CTC727  
This heavy-duty, single plunger yellow top-stop palm button provides 1 NO and 1 NC contact arrangement. This 2¼” button has a mushroom-shaped plunger. The palm button cover plate has a solid neoprene gasket which provides an oil-tight seal upon installation. The force required to operate this button is 5 lb.
REPLACEMENT PARTS FOR PALM BUTTON ASSEMBLIES (CONTINUED)

YELLOW RETURN/INCH-UP PALM BUTTON
Part No. CTC740
This heavy-duty, single plunger yellow return/inch-up palm button provides 1 NO and 1 NC contact arrangement. This 2¼" button has a mushroom-shaped plunger. The palm button cover plate has a solid neoprene gasket which provides an oil-tight seal upon installation. This button is used to return/inch-up the ram on hydraulically or pneumatically operated machines. The force required to operate this button is 5 lb.

RED EMERGENCY-STOP PALM BUTTON WITH LOCKOUT
Part No. CTC736
This heavy-duty, single plunger red emergency-stop palm button provides 1 NO and 1 NC contact arrangement. This 2¼" button has a mushroom-shaped plunger with a spring latch that keeps the button latched down when pushed. A release is incorporated. It also has provisions for attaching a padlock to the latch. The palm button cover plate has a solid neoprene gasket which provides an oil-tight seal upon installation. The force required to operate this button is 12.5 lb.

MOUNTING BOXES (WITH ¾” NPT THREADED HUBS)
Part No. CTK004
A single-hub mounting box is supplied with all palm button assemblies. It is used when wire terminates at this box. It can also be used when remote mounting electrical cut-off systems or duplex power outlets.

Part No. CTK003
A double-hub mounting box is supplied with all palm button assemblies. It is used when wires are required to go through the box and on to another mounting box.
DANGER SIGNS AND LABELS

The signs offered in this catalog are .055" thick linear polyethylene. They are semi-rigid plastic and are capable of withstanding a temperature range of -60° to 130° F. They are resistant to tears and may be mounted with nails, rivets, screws, bolts, nylon lock-straps, double-face adhesive tape, etc. Each sign is protected from fading, chipping, scratching, weather extremes, physical abuse, grease, oil, moisture, chemicals and acids. These signs do not rust, dent, or corrode. They do not curl up or rip and are lightweight and easy to handle.

**GUIDE FOR THE INSPECTION OF MECHANICAL POWER PRESSES**

*Inspect for Code Violations, defects, missing parts, malfunctions, maintenance

**INSPECTION OF**

1. **Frame**
   - Cracks? Broken or loose parts? Loose hold down bolts?

2. **Motor**
   - Clean? Lubrication? Overheating?

3. **Flywheel**
   - Rotates in correct direction? Free running? Covered?

4. **Gears**
   - Cracks? Bent?

5. **Crankshaft**
   - Proper clearance in bearings?
   - Full-revolution: single-stroke capability, loose or worn parts, including linkage?
   - Weak or broken springs? Compression springs operating on rod, or guided within hole or tube? Properly adjusted?

6. **Clutch**
   - Brake lining worn? Brake properly adjusted? Does it stop slide quickly?
   - Are friction brakes set with compression springs operating on rod, or guided within a hole or tube?
   - Face of ram parallel to bolster? Proper gib clearance? Any scoring?

7. **Brake**
   - Proper bearing and ball seat clearances? Screw turns freely?

8. **Ram and gib**
   - Proper and rear seat clearances?
   - Screw turns freely?

9. **Connection (pitman) & ram adjusting screw**
   - Spring type: proper adjustment? Broken springs or loose nuts? Pneumatic type: air leakage? Proper air pressure? Loose connection to slide?
   - Proper air pressure? Valve operation?
   - Pressure gauges? Leaks?

10. **Ram counterbalance**
    - Can main power switch be locked only in aof position? Grounding? Condition of wiring? Relays? Rotary limit switches?

11. **Air system**
    - Solenoids? Motor starter disconnects from voltage fluctuation or power failure? Retripping required? Is any component bypassed?
    - Non-slip pad on contact are? Shielded from accidental operation?

12. **Electrical system**
    - A) Guard – Barrier that prevents entry of operator's hands or fingers into the point-of-operation area? Adjustment and maintenance? Pinch points remaining in adjacent areas?
    - B) Presence-Sensing (light curtain or radio frequency – part-revolution clutch only) – reliable design and proper electrical tie-in to control? Fixed at proper safety distance from pinch point? Barrier guards for other hazardous point-of-operation areas?
    - C) Pullback (Pullout) – enough or too much pull on cables? Is proper adjustment being made for change in operator, die, shift? Records of inspection/maintenance being kept?
    - D) Type A or B Gate (B gate for part-revolution clutch only) – point of operation enclosed before press cycle can be initiated? Barrier guards for other hazardous point-of-operation areas?
    - E) Restraint (Holdout) – adjusted so that operator's fingers cannot reach into dies? Securely anchored? Adjusted for each operator, die, shift?
    - F) Two-hand Trip or Control (two-hand control for part-revolution clutch only) – shielded against unintended operation? Concurrent, antirepeat? Fited in place at proper safety distance from pinch point? Interrupted stroke protection and adequate holding time (for two-hand control only)?

13. **Foot switch**

14. **Point-of-operation safeguarding**

15. **Miscellaneous**

FULL-REVOLUTION OBI PRESS

Front View
CONTROL RELIABILITY

Control reliability is a term used in OSHA standard 29 CFR 1910.217 for mechanical power presses and in the ANSI B11 series of standards for safety of machine tools. A new term coming out in the ANSI standards that equates to control reliability is performance of safety-related functions. These terms deal with the part of the system that controls hazardous motion of a machine.

A much older term previously used for control reliability was fail-safe. Fail-safe was often considered the safe state or condition a machine went to when any and all possible component failure combinations occurred, including multiple and simultaneous failures. This is not possible; therefore, the term fail-safe should not be used to describe control reliability of performance of safety-related functions.

Control reliability should be present to ensure that a failure of the control system or device would not result in the loss of the safety-related functions. Control reliability is not just redundancy of components or a system; it must also include monitoring (checking). The components or systems used to provide safety-related functions require proper design and application. These components or systems include electrical, electronic, pneumatic, or hydraulic systems or devices. They frequently consist of monitored multiple, independent, parallel, or series components, subassemblies, or modules. The reliability of the mechanical portions of the machine relied upon for safety must depend on design, maintenance, proper lubrication, and proper use.

The main purpose of control reliability is to make sure the machine will stop when required in the event of a single component failure within the system. In the event of a component failure, machine actuation must be prevented, a stop command must be given, and reactivation of the machine must be prevented until the failure is corrected or the system or device is manually reset.

Two possible ways, among others, for achieving control reliability of the machine control systems or devices are by the use of:

1. Diverse redundancy with monitoring—two or more dissimilar components, subassemblies, or modules are used and the proper operation of each is verified (monitored) by the other(s) to ensure the performance of the safety functions.

2. Homogeneous redundancy with monitoring—two or more identical components, subassemblies, or modules are used and the proper operation of each is verified (monitored) by the other(s) to ensure the performance of the safety functions.

The selection and integration of the components (relays, valves, etc.), subassemblies, and modules that are designed for safety-related functions must be used when building a machine or integrating equipment to an existing machine.

Numerous details about the safety-related functions must be kept in mind to accomplish control reliability of the machine’s control system. The main concern is that the machine’s hazardous motion stops when a stop command is given.

Rockford Systems offers control reliable systems in this catalog for mechanically, hydraulically, and pneumatically operated machines.

RISK ASSESSMENT

Every day in industrial plants, machine operators, and setup and maintenance personnel are exposed to potential hazardous situations when running production, changing tools, and repairing machines. They sometimes assume a certain amount of risk around machines, knowingly or unknowingly.

We all take risks in our everyday lives during our normal, daily routines. Obviously, most of us are willing to take these risks to live a normal life. In our litigious society, some people believe the manufacturer of machinery, equipment, and products should be liable for any accidents and personal injuries that occur on machines with the machine’s operator(s) assuming no risk. In a perfectly planned and executed environment, this should hold true. However, we know machine safeguards and controls are sometimes bypassed, circumvented, misadjusted, or removed, thus creating additional risks. Machine operators can also make mistakes which can increase risks and cause injury.

For years, several European countries have been conducting risk assessments on industrial machines using the EN-1050 European Normative Standard. Most of these European countries place the safeguarding responsibility on the OEM (original equipment manufacturer). In the United States however, the responsibility for safety is placed upon the user or employer by OSHA. ANSI is trying to distribute this responsibility. They have finalized the B11.TR3:2000 Technical Report entitled Risk Assessment and Risk Reduction—a guideline to estimate, evaluate and reduce risks associated with machine tools. All other ANSI B11 series machine tool safety standards, as revised, will likely refer to this technical report.

To comply with the intent of the ANSI B11.TR3 Technical Report, the OEM, modifier (machine rebuilder, safeguard manufacturer), and the user will be required to work together more closely to determine how to properly protect or safeguard machine operators, and setup and maintenance personnel. They will need to conduct a risk/task hazard analysis and risk assessment of each machine to determine the type of safeguard to apply. A risk assessment will take into consideration several factors including the severity of harm (catastrophic, serious, moderate, or minor), and the probability of occurrence (very likely, likely, unlikely, or remote). A risk cannot be totally eliminated, so the ultimate goal is to lessen the risk until it reaches a tolerable risk level.
RISK ASSESSMENT (CONTINUED)

As an example, a risk assessment may determine the need for a safeguard across the full length of a press brake’s die area to safeguard the point of operation. A light curtain may be chosen as the safeguarding device. If the risk level is significant, the light curtain would need to be mounted properly so an operator could not reach over, under, around, or through it to get into the point of operation. Additional guards or barriers may be required on the sides of the press brake. A simple electrically interlocked cable with a warning sign could be applied to the rear of the press brake. In this example, three point-of-operation risk decisions—front, sides and rear of the press brake—have been made. Different risk decisions would have to be made for additional operators.

In industry, tolerable risk level decisions must be made in order to produce a product. Risk assessments and decisions for the methods of safeguarding used on machines are made every day, and continue to be part of every machine requirement for all production, and setup and maintenance tasks. The ANSI B11.TR 3 serves to provide a voluntary methodology for the risk assessment activity and has been described as “the greatest stride forward in the field of safety in the past 20 years.”

MACHINE SAFEGUARDING CHOICES

I. Point-of-operation safeguarding/metal fabricating machines
   A. Guards
      1. Die enclosure
      2. Fixed
      3. Interlocked
      4. Adjustable
   B. Devices
      1. Presence-sensing (light curtains or radio frequency)
      2. Two-hand control
      3. Two-hand trip
      4. Pullback
      5. Restraint
      6. Gates
      7. Drop probes
   C. Other methods
      1. Distance—safe holding (last resort)
      2. Location
      3. Hostage (see ANSI B11.19)
      4. Safe opening (adjustable stroke, sequential operation, adjustable restrictor)
      5. Part-in-place
   D. Auxiliary safety equipment
      1. Guards or barriers
      2. Mats
      3. Presence-sensing
         a. Multiple beam with larger MOS
         b. Single beam
         c. Radio frequency
      4. Emergency stop (red)
         a. Push button (multiple)
         b. Cable
         c. Trip bar
         d. Kick plate
      5. Awareness devices
         a. Barrier
         b. Visual
         c. Audible
      6. Hand-feeding tools
   II. Point-of-operation safeguarding of metal turning machines
      A. Shields (barrier)—protects employees from rotating machine components, chips & coolant
         1. Metal
         2. Plastic
         B. Guards
   III. Perimeter safeguarding (for work stations, see point of operation)
      A. Guards and barriers (latch-out/reset)
      B. Presence-sensing (latch-out/reset)
         1. Light curtains
         2. Single beams
      C. Mats (latch-out/reset)
      D. Distance—safe holding (last resort)
      E. Location
   IV. Supplemental
      A. Personal protective equipment
      B. Color-coding
      C. Warning signs
      D. Deadman—hold-to-run
      E. Training (documented)
      F. Supervision
      G. Proper lighting
      H. Inspecting
      I. Lockout/tagout (disconnects and valves)
      J. Safety blocks
      K. Spring-loaded turnover bars
      L. Covers for mechanical power-transmission apparatuses
   V. Control of hazardous motion/control reliability
      A. Electrical or electronic
      B. Pneumatic
      C. Hydraulic
   VI. Motor stop
   VII. Motor brake (electronic)
   VIII. Mechanical condition—inspection procedures
      A. Weekly with tests
      B. Periodic/regular
   IX. Safeguarding during machine setup
      A. Procedure
      B. Two-hand
      C. Lockout/tagout
   X. Safeguarding during minor repair of die or tooling
      A. Procedure
      B. Die-safety block interlocked
   XI. Safeguarding during maintenance of machine
      A. Procedure
      B. Lockout/tagout

SAFETY REQUIREMENTS FOR POWER PRESSES TAKEN FROM OSHA

Any component of the safety system mounted on this press is available from one source:

ROCKFORD SYSTEMS, LLC

OSHA’s Code of Federal Regulations can be purchased by contacting:

U.S. Government Printing Office
P.O. Box 371954
Pittsburgh, PA 15250-7954
(202) 512-1800
http://bookstore.gpo.gov

OSHA 29 CFR 1910.211, 1910.212, 1910.217, 1910.219, and 1910.147 are included in this catalog for use as a reference when determining safety requirements for bringing machines into compliance with the federal standards.

This information is a comprehensive guide to understanding Federal OSHA (Occupational Safety and Health Administration) and applying its requirements to mechanical power presses and other machines. It is copied verbatim from the Federal Register and contains all pertinent sections of the OSHA standards concerning power presses with which an employer (user) must comply. 29 CFR 1910.212 and 1910.219 can be applied to presses, press brakes and other machines discussed in this catalog as well as lathes, milling machines, etc. Safety standards for these types of machines are available from ANSI (American National Standards Institute). For a copy of the appropriate B11-series standard, see page 3 for the contact information. Be sure to review these standards before updating or installing any equipment on a machine.

If you are unfamiliar with how to properly safeguard the point of operation or how to calculate the safety distance for two-hand control, etc., we offer a series of monthly machine safeguarding seminars to educate the employer/user on the safety requirements. Please see pages 4 through 8 for further details.

Following this section is OSHA standard 29 CFR 1910.147 which contains requirements for the control of hazardous energy (lockout/tagout). This standard covers the servicing and maintenance of machines and equipment where the unexpected energizing or start-up of the machines or equipment, or release of stored energy could cause injury to employees. See page 33 for information on air lockout valves and refer to our Die Safety Blocks catalog for information on die safety blocks.
OSHA 29 CFR 1910.211—DEFINITIONS

Adjustable barrier guard means a barrier requiring adjustment for each job or die setup.

Antirepeat means the part of the clutch/brake control system designed to limit the press to a single stroke if the tripping means is held operated. Antirepeat requires release of all tripping mechanisms before another stroke can be initiated. Antirepeat is also called single stroke reset or reset circuit.

Authorized person means one to whom the authority and responsibility to perform a specific assignment has been given by the employer.

Automatic feeding means feeding wherein the material or part being processed is placed within or removed from the point of operation by a method or means not requiring action by an operator on each stroke of the press.

Belts include all power transmission belts, such as flat belts, round belts, V-belts, etc., unless otherwise specified.

Belt shifter means a device for mechanically shifting belts from tight to loose pulleys or vice versa, or for shifting belts on cones of speed pulleys.

Belt pole (sometimes called a belt shipper or shipper pole) means a device used in shifting belts on and off fixed pulleys on line or countershaft where there are no loose pulleys.

Bolster plate means the plate attached to the top of the bed of the press having drilled holes or T-slots for attaching the lower die or die shoe.

Brake means the mechanism used on a mechanical power press to stop and/or hold the crankshaft, either directly or through a gear train, when the clutch is disengaged.

Brake Monitor means a sensor designed, constructed, and arranged to monitor the effectiveness of the press braking system.

Clutch means the coupling mechanism used on a mechanical power press to couple the flywheel to the crankshaft, either directly or through a gear train.

Concurrent means acting in conjunction, and is used to describe a situation wherein two or more controls exist in an operated condition at the same time.

Continuous means uninterrupted multiple strokes of the slide without intervening stops (or other clutch control action) at the end of individual strokes.

Control System means sensors, manual input and mode selection elements, interlocking and decision-making circuitry, and output elements to press operating mechanism.

Counterbalance means the mechanism that is used to balance or support the weight of the connecting rods, slide, and slide attachments.

Device means a press control or attachment that:
(i) Restrains the operator from inadvertently reaching into the point of operation; or
(ii) Prevents normal press operation if the operator’s hands are inadvertently within the point of operation; or
(iii) Automatically withdraws the operator’s hands, if the operator’s hands are inadvertently within the point of operation as the dies close.

Die means the tooling used in a press for cutting or forming material. An upper and a lower die make a complete set.

Die builder means any person who builds dies for power presses.

Die enclosure guard means an enclosure attached to the die shoe or stripper, or both, in a fixed position.

Die set means a tool holder held in alignment by guide posts and bushings and consisting of a lower shoe, an upper shoe or punch holder, and guide posts and bushings.

Die setter means an individual who places or removes dies in or from mechanical power presses, and who, as a part of his duties, makes the necessary adjustments to cause the tooling to function properly and safely.

Die setting means the process of placing or removing dies in or from a mechanical power press, and the process of adjusting the dies, other tooling and safeguarding means to cause them to function properly and safely.

Die shoe means a plate or block upon which a die holder is mounted. A die shoe functions primarily as a base for the complete die assembly, and, when used, is bolted or clamped to the bolster plate or the face of slide.

Direct drive means the type driving arrangement wherein no clutch is used; coupling and decoupling of the driving torque is accomplished by energizing and deenergizing of a motor. Even though not employing a clutch, direct drives match the operational characteristics of “part revolution clutches” because the driving power may be disengaged during the stroke of the press.

Exposed to contact means that the location of an object is such that a person is likely to come into contact with it and be injured.

Ejector means a mechanism for removing work or material from between the dies.

Face of slide means the bottom surface of the slide to which the punch or upper die is generally attached.

Feeding means the process of placing or removing material within or from the point of operation.

Fixed barrier guard means a die space barrier attached to the press frame.

Flywheels include flywheels, balance wheels, and flywheel pulleys mounted and revolving on crankshaft of engine or other shafting.

Foot control means the foot operated control mechanism designed to be used with a clutch or clutch/brake control system.

Foot pedal means the foot operated lever designed to operate the mechanical linkage that trips a full revolution clutch.

Full-revolution clutch means a type of clutch that, when tripped, cannot be disengaged until the crankshaft has completed a full revolution and the press slide a full stroke.

Gate or movable barrier device means a movable barrier arranged to enclose the point of operation before the press stroke can be started.

Guard means a barrier that prevents entry of the operator’s hands or fingers into the point of operation.

Guide post means the pin attached to the upper or lower die shoe, operating within the bushing on the opposing die shoe, to maintain the alignment of the upper and lower dies.

Hand feeding tool means any hand-held tool designed for placing or removing material or parts to be processed within or from the point of operation.

Holdout or restraint device means a mechanism, including attachments for operator’s hands, that, when anchored and adjusted prevent the operator’s hands from entering the point of operation.
Inch means an intermittent motion imparted to the slide (on machines using part revolution clutches) by momentary operation of the “Inch” operating means. Operation of the “Inch” operating means engages the driving clutch so that a small portion of one stroke or indefinite stroking can occur, depending upon the length of time the “Inch” operating means is held operated. “Inch” is a function used by the die setter for setup of dies and tooling, but is not intended for use during production operations by the operator.

Interlocked press barrier guard means a barrier attached to the press frame and interlocked so that the press stroke cannot be started normally unless the guard itself, or its hinged or movable sections, enclose the point of operation.

Jog means an intermittent motion imparted to the slide by momentary operation of the drive motor, after the clutch is engaged with the flywheel at rest.

Knockout means a mechanism for releasing material from either die.

Liftout means the mechanism also known as knockout.

Maintenance runway means any permanent runway or platform used for oiling, maintenance, running adjustment, or repair work, but not for passageway.

Manual feeding means feeding wherein the material or part being processed is handled by the operator on each stroke of the press.

Nip-point belt and pulley guard means a device which encloses the pulley and is provided with rounded or rolled edge slots through which the belt passes.

Operator’s station means the complete complement of controls used by or available to an operator on a given operation for stroking the press.

Part-revolution clutch means a type of clutch that can be disengaged at any point before the crankshaft has completed a full revolution and the press slide a full stroke.

Pinch point means any point other than the point of operation at which it is possible for a part of the body to be caught between the moving parts of a press or auxiliary equipment, or between moving and stationary parts of a press or auxiliary equipment or between the material and moving part or parts of the press or auxiliary equipment.

Point of operation means the area of the press where material is actually positioned and work is being performed during any process such as shearing, punching, forming, or assembling.

Presence-sensing device means a device designed, constructed and arranged to create a sensing field or area and to deactivate the clutch control when an operator’s hand or any other part of his body is within such field or area.

Press means a mechanically powered machine that shears, punches, forms or assembles metal or other material by means of cutting, shaping, or combination dies attached to slides. A press consists of a stationary bed or anvil, and a slide (or slides) having a controlled reciprocating motion toward and away from the bed surface, the slide being guided in a definite path by the frame of the press.

Prime movers include steam, gas, oil, and air engines, motors, steam and hydraulic turbines, and other equipment used as a source of power.

Pullout device means a mechanism attached to the operator’s hands and connected to the upper die or slide of the press, that is designed, when properly adjusted, to withdraw the operator’s hands as the dies close, if the operator’s hands are inadvertently within the point of operation.

Repeat means an unintended or unexpected successive stroke of the press resulting from a malfunction.

Safety block means a prop that, when inserted between the upper and lower dies or between the bolster plate and the face of the slide, prevents the slide from falling of its own deadweight.

Safety system means the integrated total system, including the pertinent elements of the press, the controls, the safeguarding and any required supplemental safeguarding, and their interfaces with the operator, and the environment, designed, constructed and arranged to operate together as a unit, such that a single failure or single operating error will not cause injury to personnel due to point of operation hazards.

Semiautomatic feeding means feeding wherein the material or part being processed is placed within or removed from the point of operation by an auxiliary means controlled by the operator on each stroke of the press.

Sheaves mean grooved pulleys, and shall be so classified unless used as flywheels.

Single stroke means one complete stroke of the slide, usually initiated from a full open (or up) position, followed by closing (or down), and then a return to the full open position.

Single-stroke mechanism means an arrangement used on a full-revolution clutch to limit the travel of the slide to one complete stroke at each engagement of the clutch.

Slide means the main reciprocating press member. A slide is also called a ram, plunger, or plat en.

Stop control means an operator control designed to immediately deactivate the clutch control and activate the brake to stop slide motion.

Stripper means a mechanism or die part for removing the parts or material from the punch.

Stroking selector means the part of the clutch/brake control that determines the type of stroking when the operating means is actuated. The stroking selector generally includes positions for Off (Clutch Control), Inch, Single Stroke, and Continuous (when Continuous is furnished).

Sweep device means a single or double arm (rod) attached to the upper die or slide of the press and designed to move the operator’s hands to a safe position as the dies close, if the operator’s hands are inadvertently within the point of operation.

Trip or (tripping) means activation of the clutch to “run” the press.

Turnover bar means a bar used in die setting to manually turn the crankshaft of the press.

Two-hand trip means a clutch actuating means requiring the concurrent use of both hands of the operator to trip the press.

Two-hand control device means a two-hand trip that further requires concurrent pressure from both hands of the operator during a substantial part of the die-closing portion of the stroke of the press.

Unitized tooling means a type of die in which the upper and lower members are incorporated into self-contained units arranged as to hold the die members in alignment.
OSHA 29 CFR 1910.217—MECHANICAL POWER PRESSES

EDITED FOR POWER PRESSES

Many people find the OSHA standards confusing and difficult to read as published in the Code of Federal Regulations. As an aid to the metal stampers and fabricators, we have rearranged and labeled certain paragraphs and sections to help categorize the subject material. Each paragraph has been identified so that the reader can refer to the regulations and read the paragraph in context as the government wrote it. No words of the text have been changed; however, this information should never be used in place of the actual standards. We can assume no liability for acts taken as a result of reference to it. We offer this guide for use in analyzing problems and finding solutions for bringing full- and part-revolution mechanical power presses into compliance with the federal regulations.

WHEN MUST THINGS BE DONE?

(A)(4) RECONSTRUCTION AND MODIFICATION
It shall be the responsibility of any person reconstructing, or modifying a mechanical power press to do so in accordance with paragraph (b) of this section.

(A)(5) EXCLUDED MACHINES
Press brakes, hydraulic and pneumatic power presses, bulldozers, hot bending and hot metal presses, forging presses and hammers, riveting machines and similar types of fastener applicators are excluded from the requirements of this section.

CONSTRUCTION OF PRESS AND ITS CONTROLS —FULL REVOLUTION CLutches

(B)(3) MACHINES USING FULL REVOLUTION POSITIVE CLutches
(i) Machines using full revolution clutches shall incorporate a single stroke mechanism.
(ii) If the single stroke mechanism is dependent upon spring action, the spring(s) shall be of the compression type, operating on a rod or guided within a hole or tube, and designed to prevent interleaving of the spring coils in event of breakage.

METHODS OF INITIATING PRESS CYCLE

(B)(4) FOOT PEDALS (TREADLE)
(i) The pedal mechanism shall be protected to prevent unintended operation from falling or moving objects or by accidental stepping onto the pedal.
(ii) A pad with a nonslip contact area shall be firmly attached to the pedal.
(iii) The pedal return spring(s) shall be of the compression type, operating on a rod or guided within a hole or tube, and designed to prevent interleaving of spring coils in event of breakage.
(iv) If pedal counterweights are provided, the path of the travel of the weight shall be enclosed.

(B)(5) HAND OPERATED LEVERS
(i) Hand-lever-operated power presses shall be equipped with a spring latch on the operating lever to prevent premature or accidental tripping.
(ii) The operating levers on hand-tripped presses having more than one operating station shall be interlocked to prevent the tripping of the press except by the “concurrent” use of all levers.

(B)(6) TWO-HAND TRIP
See page 108, paragraph (c)(3)(viii).
(i) A two-hand trip shall have the individual operator’s hand controls protected against unintentional operation and have the individual operator’s hand controls arranged by design and construction and/or separation to require the use of both hands to trip the press and use a control arrangement requiring concurrent operation of the individual operator’s hand controls.
(ii) Two-hand trip systems on full revolution clutch machines shall incorporate an antirepeat feature.
(iii) If two-hand trip systems are used on multiple operator presses, each operator shall have a separate set of controls.
OSHA 29 CFR 1910.217—MECHANICAL POWER PRESSES (CONTINUED)

PART REVOLUTION CLUTCHES
(AIR AND MECHANICAL-FRICTION CLUTCHES)

(B)(7) MACHINES USING PART REVOLUTION CLUTCHES

(i) The clutch shall release and the brake shall be applied when the external clutch engaging means is removed, deactivated or deenergized.

Stop control

(ii) A red color stop control shall be provided with the clutch/brake control system. Momentary operation of the stop control shall immediately deactivate the clutch and apply the brake. The stop control shall override any other control, and reactivation of the clutch shall require use of the operating (tripping) means which has been selected.

Press stroking selector

(iii) A means of selecting Off, Inch, Single Stroke, and Continuous (when the continuous function is furnished) shall be supplied with the clutch/brake control to select type of operation of the press. Fixing of selection shall be by means capable of supervision by the employer.

Inch operation

(iv) The “Inch” operating means shall be designed to prevent exposure of the worker’s hands within the point of operation by:

(a) Requiring the concurrent use of both hands to actuate the clutch; OR

(b) Being a single control protected against accidental actuation and so located that the worker cannot reach into the point of operation while operating the single control.

Single stroke - Two-hand control

See page 107, paragraph (c)(3)(vii)

(v) Two-hand controls for single stroke shall conform to the following requirements:

(a) Each hand control shall be protected against unintentional operation and arranged by design, construction, and/or separation so that the concurrent use of both hands is required to trip the press.

(b) The control system shall be designed to permit an adjustment which will require concurrent pressure from both hands during the die closing portion of the stroke.

(c) The control system shall incorporate an antirepeat feature.

(d) The control systems shall be designed to require release of all operators’ hand controls before an interrupted stroke can be resumed. This requirement pertains only to those single stroke, two-hand controls manufactured and installed on or after August 31, 1971. (Refer to (c)(5)(ii) on page 108.)

(ii) Reserved

Multiple operating stations

(vii) Controls for more than one operating station shall be designed to be activated and deactivated in complete sets of two operators’ hand controls per operating station by means capable of being supervised by the employer. The clutch/brake control system shall be designed and constructed to prevent actuation of the clutch if all operating stations are bypassed.

Continuous

(viii) Those clutch/brake control systems which contain both single and continuous functions shall be designed so that completion of continuous circuits may be supervised by the employer. The initiation of continuous run shall require a prior action or decision by the operator in addition to the selection of Continuous on the stroking selector, before actuation of the operating means will result in continuous stroking.

Hand/foot selection

(ix) If foot control is provided, the selection method between hand and foot control shall be separate from the stroking selector and shall be designed so that the selection may be supervised by the employer.

Foot control

(x) Foot operated tripping controls, if used, shall be protected so as to prevent operation from falling or moving objects, or from unintended operation by accidental stepping onto the foot control.

Clutch/brake air valve failure

(xi) The control of air-clutch machines shall be designed to prevent a significant increase in the normal stopping time due to a failure within the operating valve mechanism, and to inhibit further operation if such failure does occur. This requirement shall apply only to those clutch/brake air valve controls manufactured and installed on or after August 31, 1971, but shall not apply to machines intended only for continuous, automatic feeding applications. (Refer to (c)(5)(iii) on page 108.)

Press drive motor interlock

(xii) The clutch/brake control shall incorporate an automatic means to prevent initiation or continued activation of the Single Stroke or continuous functions unless the press drive motor is energized and in the forward direction.

Engaging method failure

(xiii) The clutch/brake control shall automatically deactivate in event of failure of the power or pressure supply for the clutch engaging means. Reactivation of the clutch shall require restoration of normal supply and the use of the tripping mechanism(s).

Air counterbalance supply

(xiv) The clutch/brake control shall automatically deactivate in event of failure of the counterbalance(s) air supply. Reactivation of the clutch shall require restoration of normal air supply and use of the tripping mechanism(s).

Turnover bar operation

(xv) Selection of bar operation shall be by means capable of being supervised by the employer. A separate pushbutton shall be employed to activate the clutch, and the clutch shall be activated only if the drive motor is deenergized.
OSHA 29 CFR 1910.217—MECHANICAL POWER PRESSES (CONTINUED)

METHODS OF SAFEGUARDING THE POINT OF OPERATION

(C)(1) GENERAL REQUIREMENTS

(i) It shall be the responsibility of the employer to provide and insure the usage of “point-of-operation guards” or properly applied and adjusted point-of-operation devices on every operation performed on a mechanical power press. See Table O-10.

(ii) The requirement of paragraph (C)(1)(i) of this section shall not apply when the point-of-operation opening is one-fourth inch or less. See Table O-10.

(C)(2) POINT OF OPERATION GUARDS

(i) Every point of operation guard shall meet the following design, construction, application, and adjustment requirements:

(a) It shall prevent entry of hands or fingers into the point of operation by reaching through, over, under or around the guard;

(b) It shall conform to the maximum permissible openings of Table O-10;

(c) It shall, in itself, create no pinch point between the guard and moving machine parts;

(d) It shall utilize fasteners not readily removable by operator, so as to minimize the possibility of misuse or removal of essential parts;

(e) It shall facilitate its inspection, and

(f) It shall offer maximum visibility of the point of operation consistent with the other requirements.

(ii) A die enclosure guard shall be attached to the die shoe or stripper in a fixed position.

(iii) A fixed barrier guard shall be attached securely to the frame of the press or to the bolster plate.

(iv) An interlocked press barrier guard shall be attached to the press frame or bolster and shall be interlocked with the press clutch control so that the clutch cannot be activated unless the guard itself, or the hinged or movable sections of the guard are in position to conform to the requirements of Table O-10.

(v) The hinged or movable sections of an interlocked press barrier guard shall not be used for manual feeding. The guard shall prevent opening of the interlocked section and reaching into the point of operation prior to die closure or prior to the cessation of slide motion. See paragraph (C)(3)(ii) of this section regarding manual feeding through interlocked press barrier devices.

(vi) The adjustable barrier guard shall be securely attached to the press bed, bolster plate, or die shoe, and shall be adjusted and operated in conformity with Table O-10 and the requirements of this subparagraph. Adjustments shall be made only by authorized personnel whose qualifications include a knowledge of the provisions of Table O-10 and this subparagraph.

(vii) A point of operation enclosure which does not meet the requirements of this subparagraph and Table O-10 shall be used only in conjunction with point-of-operation devices.

Explanation of above diagram:

This diagram shows the accepted safe openings between the bottom edge of a guard and feed table at various distances from the danger line (point of operation).

The clearance line marks the distance required to prevent contact between guard and moving parts.

The minimum guarding line is the distance between the infeed side of the guard and the danger line which is one-half inch from the clearance line.

The various openings are such that for average size hands an operator’s fingers won’t reach the point of operation.

After installation of point-of-operation guards and before a machine is released for operation, a check should be made to verify that the guard will prevent the operator’s hands from reaching the point of operation.

### TABLE O-10

<table>
<thead>
<tr>
<th>Distance of opening from point-of-operation hazard (inches)</th>
<th>Maximum width of opening (inches)</th>
</tr>

This table shows the distances that guards shall be positioned from the danger line in accordance with the required openings.
(C)(3) POINT OF OPERATION DEVICES

(i) Point of operation devices shall protect the operator by:

(a) Preventing and/or stopping normal stroking of the press if the operator's hands are inadvertently placed in the point of operation; or

(b) Preventing the operator from inadvertently reaching into the point of operation; or withdrawing his hands if they are inadvertently located in the point of operation as the dies close; or

(c) Preventing the operator from inadvertently reaching into the point of operation at all times; or

(d) [Reserved] (formerly sweep device)

(e) Requiring application of both of the operator's hands to machine operating controls and locating such controls at such a safety distance from the point of operation that the slide completes the downstroke travel or stops before the operator can reach into the point of operation with his hands; or

(f) Enclosing the point of operation before a press stroke can be initiated, and maintaining this closed condition until the motion of the slide has ceased; or

(g) Enclosing the point of operation before a press stroke can be initiated, so as to prevent an operator from reaching into the point of operation prior to die closure or prior to cessation of slide motion during the downstroke stroke.

Gate or movable barrier device

(ii) A gate or movable barrier device shall protect the operator as follows:

(a) A Type A gate or movable barrier device shall protect the operator in the manner specified in paragraph (c)(3)(i)(f) of this section, and

(b) A Type B gate or movable barrier device shall protect the operator in the manner specified in paragraph (c)(3)(i)(g) of this section.

Presence sensing

(iii) A presence sensing point of operation device shall protect the operator as provided in paragraph (c)(3)(i)(a) of this section, and shall be interlocked into the control circuit to prevent or stop slide motion if the operator's hand or other part of his body is within the sensing field of the device during the downstroke of the press slide.

(a) The devices may not be used on machines using full revolution clutches.

(b) The devices may not be used as a tripping means to initiate slide motion, except when used in total conformance with paragraph (h) of this section. (Paragraph (h) omitted.)

(c) The device shall be constructed so that a failure within the system does not prevent the normal stopping action from being applied to the press when required, but does prevent the initiation of a successive stroke until the failure is corrected. The failure shall be indicated by the system.

(d) Muting (bypassing of the protective function) of such device during the upstroke of the press slide is permitted for the purpose of parts ejection, circuit checking, and feeding.

(e) The safety distance (Ds) from the sensing field to the point of operation shall be greater than the distance determined by the following formula:

\[ Ds = 63 \text{ inches/second} \times Ts \]

where:

Ds = minimum safety distance (inches);
63 inches/second = hand speed constant; and
Ts = stopping time of the press measured at approximately 90° position of the crankshaft rotation (seconds).

(f) Guards shall be used to protect all areas of entry to the point of operation not protected by the presence sensing device.

Pull-out (pullback)

(iv) The pull-out device shall protect the operator as specified in paragraph (c)(3)(i)(b) of this section and shall include attachments for each of the operator's hands.

(a) Attachments shall be connected to and operated only by the press slide or upper die.

(b) Attachments shall be adjusted to prevent the operator from reaching into the point of operation or to withdraw the operator's hands from the point of operation before the dies close.

(c) A separate pull-out device shall be provided for each operator if more than one operator is used on the press.

(d) Each pull-out device in use shall be visually inspected and checked for proper adjustment at the start of each operator shift, following a new die setup, and when operators are changed. Necessary maintenance or repair or both shall be performed and completed before the press is operated. Records of inspections and maintenance shall be kept in accordance with paragraph (a) of this section.

Sweep

(v) The sweep device may not be used for point-of-operation safeguarding after December 31, 1976.

Holdout or restraint

(vi) A holdout or a restraint device shall protect the operator as specified in paragraph (c)(3)(i)(c) of this section and shall include attachments for each of the operator's hands. Such attachments shall be securely anchored and adjusted in such a way that the operator is restrained from reaching into the point of operation. A separate set of restraints shall be provided for each operator if more than one operator is required on a press.

Two-hand control (part revolution only)

(vii) The two-hand control device shall protect the operator as specified in paragraph (c)(3)(i)(e) of this section.

(a) When used in press operations requiring more than one operator, separate two-hand controls shall be provided for each operator, and shall be designed to require concurrent application of all operators' controls to activate the slide. The removal of a hand from any control button shall cause the slide to stop.

(b) Each two-hand control shall meet the construction requirements of paragraph (b)(7)(v) of this section.

(c) The safety distance (Ds) between each two-hand control device and the point of operation shall be greater than the distance determined by the following formula:

\[ Ds = 63 \text{ inches/second} \times Ts \]

where:

Ds = minimum safety distance (inches);
63 inches/second = hand speed constant; and
Ts = stopping time of the press measured at approximately 90° position of the crankshaft rotation (seconds).

(d) Two-hand controls shall be fixed in position so that only a supervisor or safety engineer is capable of relocating the controls.
Two-hand trip

(iii) The two-hand trip device shall protect the operator as specified in paragraph (c)(3)(i)(e) of this section.

(a) When used in press operations requiring more than one operator, separate two-hand trips shall be provided for each operator, and shall be designed to require concurrent application of all operator controls to activate the slide.

(b) Each two-hand trip shall meet the construction requirements of paragraph (b)(6) of this section.

(c) The safety distance (Dm) between the two-hand trip and the point of operation shall be greater than the distance determined by the following formula:

\[ Dm = 63 \text{ inches/second} \times Tm; \]

where:

\[ Dm = \text{minimum safety distance (inches)}; \]

\[ 63 \text{ inches/second} = \text{hand speed constant}; \]

and

\[ Tm = \text{the maximum time the press takes for the die closure after it has been tripped (seconds). For full revolution clutch presses with only one engaging point, Tm is equal to the time necessary for one and one-half revolutions of the crankshaft. For full revolution clutch presses with more than one engaging point, Tm shall be calculated as follows:} \]

(d) Two-hand trips shall be fixed in position so that only a supervisor or safety engineer is capable of relocating the controls.

(C)(4) HAND FEEDING TOOLS

Hand feeding tools are intended for placing and removing materials in and from the press. Hand feeding tools are not a point of operation guard or protection device and shall not be used in lieu of the "guards" or devices required in this section.

*(C)(5) ADDED REQUIREMENTS

Additional requirements for safeguarding. Where the operator feeds or removes parts by placing one or both hands in the point of operation, and a two-hand control, presence sensing device or Type B gate or movable barrier (on a part revolution clutch) is used for safeguarding:

(i) The employer shall use a control system and a brake monitor which comply with paragraphs (b)(13) and (14) of this section. This requirement shall be complied with by November 1, 1975;

(ii) The exception in paragraph (b)(7)(v)(d) of this section for two-hand controls manufactured and installed before August 31, 1971, is not applicable under this paragraph (c)(5);

(iii) The control of air clutch machines shall be designed to prevent a significant increase in the normal stopping time due to a failure within the operating valve mechanism, and to inhibit further operation if such failure does occur, where a part revolution clutch is employed. The exception in paragraph (b)(7)(px) of this section for controls manufactured and installed before August 31, 1971, is not applicable under this paragraph (c)(5).

(B)(13) CONTROL RELIABILITY*

When required by paragraph (c)(5) of this section, the control system shall be constructed so that a failure within the system does not prevent the normal stopping action from being applied to the press when required, but does prevent initiation of a successive stroke until the failure is corrected. The failure shall be detectable by a simple test, or indicated by the control system. This requirement does not apply to those elements of the control system which have no effect on the protection against point of operation injuries.

(B)(14) BRAKE MONITORING*

When required by paragraph (c)(5) of this section, the brake monitor shall meet the following requirements:

(i) Be so constructed as to automatically prevent the activation of a successive stroke if the stopping time or braking distance deteriorates to a point where the safety distance being utilized does not meet the requirements set forth in paragraph (c)(3)(iii)(e) or (c)(3)(vii)(c) of this section. The brake monitor used with the Type B gate or movable barrier device shall be installed in a manner to detect slide top-stop overrun beyond the normal limit reasonably established by the employer;

(ii) Be installed on a press so that it indicates when the performance of the braking system has deteriorated to the extent described in paragraph (b)(14)(i) of this section; and

(iii) Be constructed and installed in a manner to monitor brake system performance on each stroke.

*Applies to part revolution only.
CONSTRUCTION OF PRESS AND ITS CONTROLS  
—FOR ALL PRESSES  

(B)(1) HAZARDS TO PERSONNEL ASSOCIATED WITH BROKEN OR FALLING MACHINE COMPONENTS  
Machine components shall be designed, secured or covered to minimize hazards caused by breakage or loosening and falling or release of mechanical energy (i.e., broken springs).

(B)(2) BRAKES  
Friction brakes provided for stopping or holding a slide movement shall be inherently self-engaging by requiring power or force from an external source to cause disengagement. Brake capacity shall be sufficient to stop the motion of the slide quickly and capable of holding the slide and its attachments at any point in its travel.

(B)(8) ELECTRICAL DISCONNECT  
(i) A main power disconnect switch capable of being locked only in the Off position shall be provided with every power press control system.  
(ii) The motor start button shall be protected against accidental operation.  
(iii) All mechanical power press controls shall incorporate a type of drive motor starter that will disconnect the drive motor from the power source in event of control voltage or power source failure, and require operation of the motor start button to restart the motor when voltage conditions are restored to normal.  
(iv) All a.c. control circuits and solenoid valve coils shall be powered by not more than a nominal 120-volt a.c. supply obtained from a transformer with an isolated secondary. Higher voltages that may be necessary for operation of machine or control mechanisms shall be isolated from any control mechanism handled by the operator, but motor starters with integral Start-Stop buttons may utilize line voltage control. All d.c. control circuits shall be powered by not more than a nominal 240-volt d.c. supply isolated from any higher voltage.

Ground  
(v) All clutch/brake control electrical circuits shall be protected against the possibility of an accidental ground in the control circuit causing false operation of the press.  

Control circuit  
(vi) All clutch/brake control circuits shall incorporate features to minimize the possibility of an unintended stroke in the event of the failure of a control component to function properly, including relays, limit switches, and static output circuits.

(B)(9) SLIDE COUNTERBALANCE SYSTEMS  
(i) Spring counterbalance systems, when used, shall incorporate means to retain system parts in event of breakage.  
(ii) Spring counterbalances, when used, shall have the capability to hold the slide and its attachments at midstroke, without brake applied.  
(iii) Air counterbalance cylinders shall incorporate means to retain the piston and rod in case of breakage or loosening.  
(iv) Air counterbalance cylinders shall have adequate capability to hold the slide and its attachments at any point in stroke, without brake applied.  
(v) Air counterbalance cylinders shall incorporate means to prevent failure of capability (sudden loss of pressure) in event of air supply failure.

(B)(10) AIR CONTROLLING EQUIPMENT  
Air controlling equipment shall be protected against foreign material and water entering the pneumatic system of the press. A means of air lubrication shall be provided when needed.

(B)(11) HYDRAULIC EQUIPMENT  
The maximum anticipated working pressures in any hydraulic system on a mechanical power press shall not exceed the safe working pressure rating of any component used in the system.

(B)(12) PRESSURE VESSELS  
All pressure vessels used in conjunction with power presses shall conform to the American Society of Mechanical Engineers Code for Pressure Vessels, 1968 Edition. (Also see 1910.169 Air Receivers.)

__________________________________________________________

DESIGN, CONSTRUCTION, SETTING AND FEEDING OF DIES

(D)(1) GENERAL REQUIREMENTS  
The employer shall: (i) use dies and operating methods designed to control or eliminate hazards to operating personnel, and (ii) furnish and enforce the use of hand tools for freeing and removing stuck work or scrap pieces from the die, so that no employee need reach into the point of operation for such purposes.

(D)(2) RESERVED

(D)(3) SCRAP HANDLING  
The employer shall provide means for handling scrap from roll feed or random length stock operations. Scrap cutters used in conjunction with scrap handling systems shall be safeguarded in accordance with paragraph (c) of this section and with 1910.219.
OSHA 29 CFR 1910.217—MECHANICAL POWER PRESSES (CONTINUED)

(D)(4) GUIDE POST HAZARD
The hazard created by a guide post (when it is located in the immediate vicinity of the operator) when separated from its bushing by more than one-fourth inch shall be considered as a point of operation hazard and be protected in accordance with paragraph (c) of this section.

(D)(5) UNITIZED TOOLING
If unitized tooling is used, the opening between the top of the punch holder and the face of the slide, or striking pad, shall be safeguarded in accordance with the requirements of paragraph (c) of this section.

(D)(6) TONNAGE, STROKE, AND WEIGHT DESIGNATION
All dies shall be:
(i) Stamped with the tonnage and stroke requirements; or have these characteristics recorded if these records are readily available to the die setter;
(ii) Stamped to indicate upper die weight when necessary for air counterbalance pressure adjustment; and
(iii) Stamped to indicate complete die weight when handling equipment may become overloaded.

(D)(7) DIE FASTENING
Provision shall be made in both the upper and lower shoes for securely mounting the die to the bolster and slide. Where clamp caps or setscrews are used in conjunction with punch stems, additional means of securing the upper shoe to the slide shall be used.

(D)(8) DIE HANDLING
Handling equipment attach points shall be provided on all dies requiring mechanical handling.

(D)(9) DIE SETTING
(i) The employer shall establish a die setting procedure that will insure compliance with paragraph (c) of this section.
(ii) The employer shall provide spring loaded turnover bars, for presses designed to accept such turnover bars.
(iii) The employer shall provide die stops or other means to prevent losing control of the die while setting or removing dies in presses which are inclined.
(iv) The employer shall provide and enforce the use of safety blocks for use whenever dies are being adjusted or repaired in the press.
(v) The employer shall provide brushes, swabs, lubricating rolls, and automatic or manual pressure guns so that operators and die setters shall not be required to reach into the point of operation or other hazard areas to lubricate material, punches or dies.

(E)(1) INSPECTION AND MAINTENANCE RECORDS
(i) It shall be the responsibility of the employer to establish and follow a program of periodic and regular inspections of his power presses to insure that all their parts, auxiliary equipment, and safeguards are in a safe operating condition and adjustment. The employer shall maintain a certification record of inspections which includes the date of inspection, the signature of the person who performed the inspection, and the serial number, or other identifier, of the power press that was inspected.
(ii) Each press shall be inspected and tested no less than weekly to determine the condition of the clutch/brake mechanism-antirepeat feature and single stroke mechanism. Necessary maintenance or repair or both shall be performed and completed before the press is operated. These requirements do not apply to those presses which comply with paragraphs (b)(13) and (14) of this section. The employer shall maintain a certification record of inspections, tests and maintenance work which includes the date of the inspection, test or maintenance; the signature of the person who performed the inspection, test, or maintenance; and the serial number or other identifier of the press that was inspected, tested or maintained.

(E)(2) MODIFICATION
It shall be the responsibility of any person modifying a power press to furnish instructions with the modification to establish new or changed guidelines for use and care of the power press so modified.

(E)(3) TRAINING OF MAINTENANCE PERSONNEL
It shall be the responsibility of the employer to insure the original and continuing competence of personnel caring for, inspecting, and maintaining power presses.

INSPECTION, MAINTENANCE, AND MODIFICATION OF PRESSES

(F)(1) RESERVED

(F)(2) INSTRUCTION TO OPERATORS
The employer shall train and instruct the operator in the safe method of work before starting work on any operation covered by this section. The employer shall insure by adequate supervision that correct operating procedures are being followed.

(F)(3) WORK AREA
The employer shall provide clearance between machines so that movement of one operator will not interfere with the work of another. Ample room for cleaning machines, handling material, work pieces, and scrap shall also be provided. All surrounding floors shall be kept in good condition and free from obstructions, grease, oil, and water.

(F)(4) OVERLOADING
The employer shall operate his presses within the tonnage and attachment weight ratings specified by the manufacturer.
OSHA 29 CFR 1910.217—MECHANICAL POWER PRESSES (CONTINUED)

REPORTS OF INJURIES TO EMPLOYEES
OPERATING MECHANICAL POWER PRESSES

(g)(1) The employer shall, within 30 days of the occurrence, report to either the Director of the Directorate of Safety Standards Programs, OSHA, U.S. Department of Labor, Washington, D.C. 20210, or the State agency administering plan approved by the Assistant Secretary of Labor for Occupational Safety and Health, all point of operation injuries to operators or other employees. The following information shall be included in the report:

(i) Employer’s name, address and location of the workplace (establishment).

(ii) Employee’s name, injury sustained, and the task being performed (operation, setup, maintenance, or other).

(iii) Type of clutch used on the press (full revolution, part revolution or direct drive).

(iv) Type of safeguard(s) being used (two-hand control, two-hand trip, pullouts, sweeps or other). If the safeguard is not described in this section, give a complete description.

(v) Cause of the accident (repeat of press, safeguard failure, removing stuck part or scrap, no safeguard provided, no safeguard in use or other).

(vi) Type of feeding (manual with hands in dies or with hands out of dies, semi-automatic, automatic or other).

(vii) Means used to actuate press stroke (foot trip, foot control, hand control or other).

(viii) Number of operators required for the operation and the number of operators provided with controls and safeguards.

OSHA 29 CFR 1910.212—GENERAL REQUIREMENTS FOR ALL MACHINES

(a) Machine guarding—(1) Types of guarding. One or more methods of machine guarding shall be provided to protect the operator and other employees in the machine area from hazards such as those created by point of operation, ingoing nip points, rotating parts, flying chips and sparks. Examples of guarding methods are—barrier guards, two-hand tripping devices, electronic safety devices, etc.

(2) General requirements for machine guards. Guards shall be affixed to the machine where possible and secured elsewhere if for any reason attachment to the machine is not possible. The guard shall be such that it does not offer an accident hazard in itself.

(3) Point of operation guarding. (i) Point of operation is the area on a machine where work is actually performed upon the material being processed.

(ii) The point of operation of machines whose operation exposes an employee to injury shall be guarded. The guarding device shall be in conformity with any appropriate standards therefor; or, in the absence of applicable specific standards, shall be so designed and constructed as to prevent the operator from having any part of his body in the danger zone during the operating cycle.

(iii) Special hand tools for placing and removing material shall be such as to permit easy handling of material without the operator placing a hand in the danger zone. Such tools shall not be in lieu of other guarding required by this section, but can only be used to supplement protection provided.

(iv) The following are some of the machines which usually require point of operation guarding:

(a) Guillotine cutters
(b) Shears
(c) Alligator shears
(d) Power presses
(e) Milling machines
(f) Power saws
(g) Jointers
(h) Portable power tools
(l) Forming rolls and calenders

(4) Barrels, containers and drums. Revolving drums, barrels and containers shall be guarded by an enclosure which is interlocked with the drive mechanism, so that the barrel, drum or container cannot revolve unless the guard enclosure is in place.

(5) Exposure of blades. When the periphery of the blades of a fan is less than seven (7) feet above the floor or working level, the blades shall be guarded. The guard shall have openings no larger than one-half (1/2) inch.

(b) Anchoring fixed machinery. Machines designed for a fixed location shall be securely anchored to prevent walking or moving.
OSHA 29 CFR 1910.219—MECHANICAL POWER-TRANSMISSION APPARATUS

(a) General requirements. (1) This section covers all types and shapes of power-transmission belts, except the following when operating at two hundred and fifty (250) feet per minute or less: (i) Flat belts one (1) inch or less in width, (ii) flat belts two (2) inches or less in width which are free from metal lacings or fasteners, (iii) round belts one-half (½) inch or less in diameter; and (iv) single strand V-belts, the width of which is thirteen thirty-seconds (13/32) inch or less.

(2) Vertical and inclined belts (paragraphs (e) (3) and (4) of this section) if not more than two and one-half (2 ½) inches wide and running at a speed of less than one thousand (1,000) feet per minute, and if free from metal lacings or fastenings may be guarded with a nip-point belt and pulley guard.

(3) For the textile industry, because of the presence of excessive deposits of lint which constitutes a serious fire hazard, the sides and face sections of nip-point belt and pulley guards are required, provided the guard shall extend at least six (6) inches beyond the rim of the pulley on the in-running and off-running sides of the belt and at least two (2) inches away from the rim and face of the pulley in all other directions.

(4) This section covers the principal features with which power-transmission safeguards shall comply.

(b) Prime-mover guards—(1) Flywheels. Flywheels located so that any part is seven (7) feet or less above floor or platform shall be guarded in accordance with the requirements of this subparagraph:

(i) With an enclosure of sheet, perforated, or expanded metal, or woven wire;

(ii) With guard rails placed not less than fifteen (15) inches nor more than twenty (20) inches from rim. When flywheel extends into pit or is within twelve (12) inches of floor, a standard toeboard shall also be provided;

(iii) When the upper rim of flywheel protrudes through a working floor, it shall be entirely enclosed or surrounded by a guardrail and toeboard.

(iv) For flywheels with smooth rims five (5) feet or less in diameter, where the preceding methods cannot be applied, the following may be used: A disk attached to the flywheel in such manner as to cover the spokes of the wheel on the exposed side and present a smooth surface and edge, at the same time providing means for periodic inspection. An open space, not exceeding four (4) inches in width, may be left between the outside edge of the disk and the rim of the wheel if desired, to facilitate turning the wheel over. Where a disk is used, the keys or other dangerous projections not covered by disk shall be cut off or covered. This subdivision does not apply to flywheels with solid web centers.

(v) Adjustable guard to be used for starting engine or for running adjustment may be provided at the flywheel of gas or oil engines. A slot opening for jack bar will be permitted.

(vi) Wherever flywheels are above working areas, guards shall be installed having sufficient strength to hold the weight of the flywheel in the event of a shaft or wheel mounting failure.

(2) Cranks and connecting rods. Cranks and connecting rods, when exposed to contact, shall be guarded in accordance with paragraphs (m) and (n) of this section, or by a guardrail as described in paragraph (o)(5) of this section.

(3) Tail rods or extension piston rods. Tail rods or extension piston rods shall be guarded in accordance with paragraphs (m) and (n) of this section, or by a guardrail on sides and end, with a clearance of not less than fifteen (15) nor more than twenty (20) inches when rod is fully extended.

(c) Shafts—(1) Installation. (i) Each continuous line of shafting shall be secured in position against excessive endwise movement.

(ii) Inclined and vertical shafts, particularly inclined idler shafts, shall be securely held in position against endwise thrust.

(2) Guarding horizontal shafting. (i) All exposed parts of horizontal shafting seven (7) feet or less from floor or working platform, excepting runways used exclusively for oiling, or running adjustments, shall be protected by a stationary casing enclosing shafting completely or by a trough enclosing sides and top and sides and bottom of shafting as location requires.

(ii) Shafting under bench machines shall be enclosed by a stationary casing, or by a trough at sides and top or sides and bottom, as location requires. The sides of the trough shall come within at least six (6) inches of the underside of table, or if shafting is located near floor within six (6) inches of floor. In every case the sides of trough shall extend at least two (2) inches beyond the shafting or protuberance.

(3) Guarding vertical and inclined shafting. Vertical and inclined shafting seven (7) feet or less from floor or working platform, excepting maintenance runways, shall be enclosed with a stationary casing in accordance with requirements of paragraphs (m) and (n) of this section.

(4) Projecting shaft ends. (i) Projecting shaft ends shall present a smooth edge and end and shall not project more than one-half the diameter of the shaft unless guarded by nonrotating caps or safety sleeves.

(ii) Unused keyways shall be filled up or covered.

(5) Power-transmission apparatus located in basements. All mechanical power-transmission apparatus located in basements, towers, and rooms used exclusively for power-transmission equipment shall be guarded in accordance with this section, except that the requirements for safeguarding belts, pulleys, and shafting need not be complied with when the following requirements are met:

(i) The basement, tower, or room occupied by transmission equipment is locked against unauthorized entrance.

(ii) The vertical clearance in passageways between the floor and power-transmission beams, ceiling, or any other objects, is not less than five feet six inches (5 ft. 6 in.).

(iv) [Reserved]

(v) The route followed by the oiler is protected in such manner as to prevent accident.
(d) Pulleys—(1) Guarding. Pulleys, any parts of which are seven (7) feet or less from the floor or working platform, shall be guarded in accordance with the standards specified in paragraphs (m) and (o) of this section. Pulleys serving as balance wheels (e.g., punch presses) on which the point of contact between belt and pulley is more than six feet six inches (6 ft. 6 in.) from the floor or platform may be guarded with a disk covering the spokes.

(2) Location of pulleys. (i) Unless the distance to the nearest fixed pulley, clutch or hanger exceeds the width of the belt used, a guide shall be provided to prevent the belt from leaving the pulley on the side where insufficient clearance exists.

(ii) [Reserved]

(3) Broken pulleys. Pulleys with cracks or pieces broken out of rims shall not be used.

(4) Pulley speeds. Pulleys intended to operate at rim speed in excess of manufacturers normal recommendations shall be specially designed and carefully balanced for the speed at which they are to operate.

(e) Belt, rope, and chain drives—(1) Horizontal belts and ropes. (i) Where both runs of horizontal belts are seven (7) feet or less from the floor level, the guard shall extend to at least fifteen (15) inches above the belt or to a standard height (see Table O-12), except that where both runs of a horizontal belt are 42 inches or less from the floor, the belt shall be fully enclosed in accordance with paragraphs (m) and (o) of this section.

(ii) In power plants or power-development rooms, a guardrail may be used in lieu of the guard required by subdivision (l) of this subparagraph.

(2) Overhead horizontal belts. (i) Overhead horizontal belts, with lower parts seven (7) feet or less from the floor or platform, shall be guarded on sides and bottom in accordance with paragraph (o)(3) of this section.

(ii) Horizontal overhead belts more than seven (7) feet above floor or platform shall be guarded for their entire length under the following conditions:

(a) If located over passageways or work places and traveling 1,800 feet or more per minute.

(b) If center to center distance between pulleys is ten (10) feet or more.

(c) If belt is eight (8) inches or more in width.

(iii) Where the upper and lower runs of horizontal belts are so located that passage of persons between them would be possible, the passage shall be either:

(a) Completely barred by a guardrail or other barrier in accordance with paragraphs (m) and (o) of this section; or

(b) Where passage is regarded as necessary, there shall be a platform over the lower run guarded on either side by a railing completely filled in with wire mesh or other filler, or by a solid barrier. The upper run shall be so guarded as to prevent contact therewith either by the worker or by objects carried by him. In power plants only the lower run of the belt need be guarded.

(iv) Overhead chain and link belt drives are governed by the same rules as overhead horizontal belts and shall be guarded in the same manner as belts.

(3) Vertical and inclined belts. (i) Vertical and inclined belts shall be enclosed by a guard conforming to standards in paragraphs (m) and (o) of this section.

(ii) All guards for inclined belts shall be arranged in such a manner that a minimum clearance of seven (7) feet is maintained between belt and floor at any point outside of guard.

(4) Vertical belts. Vertical belts running over a lower pulley more than seven (7) feet above floor or platform shall be guarded at the bottom in the same manner as horizontal overhead belts, if conditions are as stated in paragraphs (e)(2)(ii)(a) and (c) of this section.

(i) If the belt is of the endless type or laced with rawhide laces, and a belt shifter is not desired, the belt will be considered guarded if the nip point of the belt and pulley is protected by a nip point guard located in front of the cone extending at least to the top of the largest step of the cone, and formed to show the contour of the cone in order to give the nip point of the belt and pulley the maximum protection.

(ii) Where suspended counterweights are used and not guarded by location, they shall be so encased as to prevent accident.

(5) Cone-pulley belts. (i) The cone belt and pulley shall be equipped with a belt shifter so constructed as to adequately guard the nip point of the belt and pulley. If the frame of the belt shifter does not adequately guard the nip point of the belt and pulley, the nip point shall be further protected by means of a vertical guard placed in front of the pulley and extending at least to the top of the largest step of the cone.

(ii) By a band guard covering the face of gear and having flanges extended inward beyond the root of the teeth on the exposed side or sides. Where any portion of the train of gears guarded by a band guard is less than six (6) feet from the floor a disk guard or a complete enclosure to the height of six (6) feet shall be required.

(6) Belt tighteners. (i) Suspended counterbalanced tighteners and all parts thereof shall be of substantial construction and securely fastened; the bearings shall be securely capped. Means must be provided to prevent tighter from falling, in case the belt breaks.

(ii) Where suspended counterweights are used and not guarded by location, they shall be so encased as to prevent accident.

(7) Gears, sprockets, and chains—(1) Gears. Gears shall be guarded in accordance with one of the following methods:

(i) By a complete enclosure; or

(ii) By a standard guard as described in paragraph (o) of this section, at least seven (7) feet high extending six (6) inches above the mesh point of the gears; or

(iii) By a band guard covering the face of gear and having flanges extended inward beyond the root of the teeth on the exposed side or sides. Where any portion of the train of gears guarded by a band guard is less than six (6) feet from the floor a disk guard or a complete enclosure to the height of six (6) feet shall be required.

(2) Hand-operated gears. Paragraph (6)(1) of this section does not apply to hand-operated gears used only to adjust machine parts and which do not continue to move after hand power is removed. However, the guarding of these gears is highly recommended.

(3) Sprockets and chains. All sprocket wheels and chains shall be enclosed unless they are more than seven (7) feet above the floor or platform. Where the drive extends over other machine or working areas, protection against falling shall be provided. This subparagraph does not apply to manually operated sprockets.
OSHA 29 CFR 1910.219—MECHANICAL POWER-TRANSMISSION APPARATUS (CONTINUED)

(4) Openings for oiling. When frequent oiling must be done, openings with hinged or sliding self-closing covers shall be provided. All points not readily accessible shall have oil feed tubes if lubricant is to be added while machinery is in motion.

(g) Guarding friction drives. The driving point of all friction drives when exposed to contact shall be guarded, all arm or spoke friction drives and all web friction drives with holes in the web shall be entirely enclosed, and all projecting belts on friction drives where exposed to contact shall be guarded.

(h) Keys, setscrews, and other projections. (1) All projecting keys, setscrews, and other projections in revolving parts shall be removed or made flush or guarded by metal cover. This subparagraph does not apply to keys or setscrews within gear or sprocket casings or other enclosures, nor to keys, setscrews, or oilcups in hubs of pulleys less than twenty (20) inches in diameter where they are within the plane of the rim of the pulley.

(2) It is recommended, however, that no projecting setscrews or oilcups be used in any revolving pulley or part of machinery.

(i) Collars and couplings—(1) Collars. All revolving collars, including split collars, shall be cylindrical, and screws or bolts used in collars shall not project beyond the largest periphery of the collar.

(2) Couplings. Shaft couplings shall be so constructed as to present no hazard from bolts, nuts, setscrews, or revolving surfaces. Bolts, nuts, and setscrews will, however, be permitted where they are covered with safety sleeves or where they are used parallel with the shafting and are countersunk or else do not extend beyond the flange of the coupling.

(j) Bearings and facilities for oiling. All drip cups and pans shall be securely fastened.

(k) Guarding of clutches, cutoff couplings, and clutch pulleys—

(1) Guards. Clutches, cutoff couplings, or clutch pulleys having projecting parts, where such clutches are located seven (7) feet or less above the floor or working platform, shall be enclosed by a stationary guard constructed in accordance with this section. A "U" type guard is permissible.

(2) Engine rooms. In engine rooms a guardrail, preferably with toeboard, may be used instead of the guard required by paragraph (k)(1) of this section, provided such a room is occupied only by engine room attendants.

(l) Belt shifters, clutches, shippers, poles, perches, and fasteners—

(1) Belt shifters. (i) Tight and loose pulleys on all new installations made on or after August 31, 1971, shall be equipped with a permanent belt shifter provided with mechanical means to prevent belt from creeping from loose to tight pulley. It is recommended that old installations be changed to conform to this rule.

(ii) Belt shifter and clutch handles shall be rounded and be located as far as possible from danger of accidental contact, but within easy reach of the operator. Where belt shifters are not directly located over a machine or bench, the handles shall be cut off six feet six inches (6 ft. 6 in.) above floor level.

(2) Belt shippers and shipper poles. The use of belt poles as substitutes for mechanical shifters is not recommended.

(3) Belt perches. Where loose pulleys or idlers are not practicable, belt perches in form of brackets, rollers, etc., shall be used to keep idle belts away from the shafts.

(4) Belt fasteners. Belts which of necessity must be shifted by hand and belts within seven (7) feet of the floor or working platform which are not guarded in accordance with this section shall not be fastened with metal in any case, nor with any other fastening which by construction or wear will constitute an accident hazard.

(m) Standard guards—general requirements—(1) Materials. (i) Standard conditions shall be secured by the use of the following materials: expanded metal, perforated or solid sheet metal, wire mesh on a frame of angle iron or iron pipe securely fastened to floor or to frame of machine.

(ii) All metal shall be free from burrs and sharp edges.

(2) Methods of manufacture. (i) Expanded metal, sheet or perforated metal, and wire mesh shall be securely fastened to frame.

(n) [Reserved]

(o) Approved materials—(1) Minimum requirements. The materials and dimensions specified in this paragraph shall apply to all guards, except horizontal overhead belts, rope, cable or chain guards more than seven (7) feet above floor or platform.

(ii) [Reserved]

(a) All guards shall be rigidly braced every three (3) feet or fractional part of their height to some fixed part of machinery or building structure. Where guard is exposed to contact with moving equipment additional strength may be necessary.

(2) Wood guards. (i) Wood guards may be used in the woodworking and chemical industries, in industries where the presence of fumes or where manufacturing conditions would cause the rapid deterioration of metal guards; also in construction work and in locations outdoors where extreme cold or extreme heat make metal guards and railings undesirable. In all other industries, wood guards shall not be used.

(3) Guards for horizontal overhead belts. (i) Guards for horizontal overhead belts shall run the entire length of the belt and follow the line of the pulley to the ceiling or be carried to the nearest wall, thus enclosing the belt effectively. Where belts are so located as to make it impracticable to carry the guard to wall or ceiling, construction of guard shall be such as to enclose completely the top and bottom runs of belt and the face of pulleys.

(ii) [Reserved]

(iii) Suitable reinforcement shall be provided for the ceiling rafters or overhead floor beams, where such is necessary, to sustain safely the weight and stress likely to be imposed by the guard. The interior surface of all guards, by which is meant the surface of the guard with which a belt will come in contact, shall be smooth and free from all projections of any character, except where construction demands it; protruding shallow roundhead rivets may be used. Overhead belt guards shall be at least one-quarter wider than belt which they protect, except that this clearance need not in any case exceed six (6) inches on each side. Overhead rope drive and block and roller-chain-drive guards shall be not less than six (6) inches wider than the drive on each side. In overhead silent chain-drive guards where the chain is held from lateral displacement on the sprockets, the side clearances required on drives of twenty (20) inch centers or under shall be not less than one-fourth inch from the nearest moving chain part, and on drives of over twenty (20) inch centers a minimum of one-half inch from the nearest moving chain part.
(4) Guards for horizontal overhead rope and chain drives. Overhead-rope and chain-drive guard construction shall conform to the rules for overhead-belt guard.

(5) Guardrails and toeboards. (i) Guardrail shall be forty-two (42) inches in height, with midrail between top rail and floor.

(ii) Posts shall be not more than eight (8) feet apart; they are to be permanent and substantial, smooth, and free from protruding nails, bolts, and splinters. If made of pipe, the post shall be one and one-fourth (1¼) inches inside diameter or larger. If made of metal shapes or bars, their section shall be equal in strength to that of one and one-half (1½) by one and one-half (1½) by three-sixteenths (3/16) inch angle iron. If made of wood, the posts shall be two by four (2 x 4) inches or larger. The upper rail shall be two by four (2 x 4) inches or two one by four (1 x 4) strips, one at the top and one at the side of posts. The midrail may be one by four (1 x 4) inches or more. Where panels are fitted with expanded metal or wire mesh as noted in Table O-12 the middle rails may be omitted. Where guard is exposed to contact with moving equipment, additional strength may be necessary.

(iii) Toeboards shall be four (4) inches or more in height, of wood, metal or of metal grill not exceeding one (1) inch mesh.

(p) Care of equipment—(1) General. All power-transmission equipment shall be inspected at intervals not exceeding 60 days and be kept in good working condition at all times.

(2) Shafting. (i) Shafting shall be kept in alignment, free from rust and excess oil or grease.

(ii) Where explosives, explosive dusts, flammable vapors or flammable liquids exist, the hazard of static sparks from shafting shall be carefully considered.

(3) Bearings. Bearings shall be kept in alignment and properly adjusted.

(4) Hangers. Hangers shall be inspected to make certain that all supporting bolts and screws are tight and that supports of hanger boxes are adjusted properly.

(5) Pulleys. (i) Pulleys shall be kept in proper alignment to prevent belts from running off.

(6) Care of belts.

(i) [Reserved]

(ii) Inspection shall be made of belts, lacings, and fasteners and such equipment kept in good repair.

(7) Lubrication. The regular oilers shall wear tight-fitting clothing. Machinery shall be oiled when not in motion, wherever possible.
OSHA 29 CFR 1910.147—THE CONTROL OF HAZARDOUS ENERGY (LOCKOUT/TAGOUT)

(a) Scope, application and purpose—(1) Scope.

(i) This standard covers the servicing and maintenance of machines and equipment in which the unexpected energizing or start-up of the machines or equipment; or release of stored energy could cause injury to employees. This standard establishes minimum performance requirements for the control of such hazardous energy.

(ii) This standard does not cover the following:

(A) Construction, agriculture and maritime employment;

(B) Installations under the exclusive control of electric utilities for the purpose of power generation, transmission and distribution, including related equipment for communication or metering; and

(C) Exposure to electrical hazards from work on, near, or with conductors or equipment in electric utilization installations, which is covered by Subpart S of this part; and

(D) Oil and gas well drilling and servicing.

(2) Application. (i) This standard applies to the control of energy during servicing and/or maintenance of machines and equipment.

(ii) Normal production operations are not covered by this standard (see Subpart O of this part). Servicing and/or maintenance which takes place during normal production operations is covered by this standard only if:

(A) An employee is required to remove or bypass a guard or other safety device; or

(B) An employee is required to place any part of his or her body into an area on a machine or piece of equipment where work is actually performed upon the material being processed (point of operation) or where an associated danger zone exists during a machine operating cycle.

Note: Exception to paragraph (a)(2)(ii):

Minor tool changes and adjustments, and other minor servicing activities, which take place during normal production operations, are not covered by this standard if they are routine, repetitive, and integral to the use of the equipment for production, provided that the work is performed using alternative measures which provide effective protection (see subpart O of this Part).

(iii) This standard does not apply to the following:

(A) Work on cord and plug connected electric equipment for which exposure to the hazards of unexpected energizing or start-up of the equipment is controlled by the unplugging of the equipment from the energy source and by the plug being under the exclusive control of the employee performing the servicing or maintenance.

(B) Hot tap operations involving transmission and distribution systems for substances such as gas, steam, water or petroleum products when they are performed on pressurized pipelines, provided that the employer demonstrates that (1) continuity of service is essential; (2) shutdown of the system is impractical; and (3) documented procedures are followed, and special equipment is used which will provide proven effective protection for employees.

(3) Purpose. (i) This section requires employers to establish a program and utilize procedures for affixing appropriate lockout devices or tagout devices to energy isolating devices, and to otherwise disable machines or equipment to prevent unexpected energizing, start-up or release of stored energy in order to prevent injury to employees.

(ii) When other standards in this part require the use of lockout or tagout, they shall be used and supplemented by the procedural and training requirements of this section.

(b) Definitions applicable to this section.

Affected employee. An employee whose job requires him/her to operate or use a machine or equipment on which servicing or maintenance is being performed under lockout or tagout, or whose job requires him/her to work in an area in which such servicing or maintenance is being performed.

Authorized employee. A person who locks or implements a tagout system procedure on machines or equipment to perform the servicing or maintenance on that machine or equipment. An authorized employee and an affected employee may be the same person when the affected employee’s duties also include performing maintenance or service on a machine or equipment which must be locked or a tagout system implemented.

“Capable of being locked out.” An energy isolating device will be considered to be capable of being locked out either if it is designed with a hasp or other attachment or integral part to which, or through which, a lock can be affixed, or if it has a locking mechanism built into it. Other energy isolating devices will also be considered to be capable of being locked out, if lockout can be achieved without the need to dismantle, rebuild, or replace the energy isolating device or permanently alter its energy control capability.

Energized. Connected to an energy source or containing residual or stored energy.

Energy isolating device. A mechanical device that physically prevents the transmission or release of energy, including but not limited to the following: a manually operated electrical circuit breaker; a disconnect switch; a manually operated switch by which the conductors of a circuit can be disconnected from all ungrounded supply conductors and, in addition, no pole can be operated independently; a slide gate; a slip blind; a line valve; a block; and any similar device used to block or isolate energy. The term does not include a push button, selector switch, and other control circuit type devices.

Energy source. Any source of electrical, mechanical, hydraulic, pneumatic, chemical, thermal or other energy.

Hot tap. A procedure used in the repair, maintenance and services activities which involves welding on a piece of equipment (pipelines, vessels or tanks) under pressure, in order to install connections or appurtenances. It is commonly used to replace or add sections of pipeline without the interruption of service for air, gas, water, steam, and petrochemical distribution systems.

Lockout. The placement of a lockout device on an energy isolating device, in accordance with an established procedure, ensuring that the energy isolating device and the equipment being controlled cannot be operated until the lockout device is removed.

Lockout device. A device that utilizes a positive means such as a lock, either key or combination type, to hold an energy isolating device in the safe position and prevent the energizing of a machine or equipment.
Normal production operations. The utilization of a machine or equipment to perform its intended production function.

Servicing and/or maintenance. Workplace activities such as constructing, installing, setting up, adjusting, inspecting, modifying, and maintaining and/or servicing machines or equipment. These activities include lubrication, cleaning or unjamming of machines or equipment and making adjustments or tool changes, where the employee may be exposed to the unexpected energizing or start-up of the equipment or release of hazardous energy.

Setting up. Any work performed to prepare a machine or equipment to perform its normal production operation.

Tagout. The placement of a tagout device on an energy isolating device, in accordance with an established procedure, to indicate that the energy isolating device and the equipment being controlled may not be operated until the tagout device is removed.

Tagout device. A prominent warning device, such as a tag and a means of attachment, which can be securely fastened to an energy isolating device in accordance with an established procedure, to indicate that the energy isolating device and the equipment being controlled may not be operated until the tagout device is removed.

(c) General—(1) Energy control program. The employer shall establish a program consisting of an energy control procedure and employee training to ensure that before any employee performs any servicing or maintenance on a machine or equipment where the unexpected energizing, start-up or release of stored energy could occur and cause injury, the machine or equipment shall be isolated, and rendered inoperative, in accordance with paragraph (c)(4) of this section.

(2) Lockout/tagout (i) If an energy isolating device is not capable of being locked out, the employer’s energy control program under paragraph (c)(1) of this section shall utilize a tagout system.

(ii) If an energy isolating device is capable of being locked out, the employer’s energy control program under paragraph (c)(1) of this section shall utilize lockout, unless the employer can demonstrate that the utilization of a tagout system will provide full employee protection as set forth in paragraph (c)(3) of this section.

(iii) After January 2, 1990, whenever major replacement, repair, renovation or modification of machines or equipment is performed, and whenever new machines or equipment are installed, energy isolating devices for such machines or equipment shall be designed to accept a lockout device.

(3) Full employee protection. (i) When a tagout device is used on an energy isolating device which is capable of being locked out, the tagout device shall be attached at the same location that the lockout device would have been attached, and the employer shall demonstrate that the tagout program will provide a level of safety equivalent to that obtained by using a lockout program.

(ii) In demonstrating that a level of safety is achieved in the tagout program which is equivalent to the level of safety obtained by using a lockout program, the employer shall demonstrate full compliance with all tagout-related provisions of this standard together with such additional elements as are necessary to provide the equivalent safety available from the use of a lockout device. Additional means to be considered as part of the demonstration of full employee protection shall include the implementation of additional safety measures such as the removal of an isolating circuit element, blocking of a controlling switch, opening of an extra disconnecting device, or the removal of a valve handle to reduce the likelihood of inadvertent energizing.

(4) Energy control procedure. (i) Procedures shall be developed, documented and utilized for the control of potentially hazardous energy when employees are engaged in the activities covered by this section.

Note: Exception: The employer need not document the required procedure for a particular machine or equipment, when all of the following elements exist: (1) The machine or equipment has no potential for stored or residual energy or reaccumulation of stored energy after shut down which could endanger employees; (2) the machine or equipment has a single energy source which can be readily identified and isolated; (3) the isolation and locking out of that energy source will completely de-energize and deactivate the machine or equipment; (4) the machine or equipment is isolated from that energy source and locked out during servicing or maintenance; (5) a single lockout device will achieve a locked-out condition; (6) the lockout device is under the exclusive control of the authorized employee performing the servicing or maintenance; (7) the servicing or maintenance does not create hazards for other employees; and (8) the employer, in utilizing this exception, has had no accidents involving the unexpected activation or reenergization of the machine or equipment during servicing or maintenance.

(ii) The procedures shall clearly and specifically outline the scope, purpose, authorization rules, and techniques to be utilized for the control of hazardous energy, and the means to enforce compliance including, but not limited to, the following:

(A) A specific statement of the intended use of the procedure;

(B) Specific procedural steps for shutting down, isolating, blocking and securing machines or equipment to control hazardous energy;

(C) Specific procedural steps for the placement, removal and transfer of lockout devices or tagout devices and the responsibility for them; and

(D) Specific requirements for testing a machine or equipment to determine and verify the effectiveness of lockout devices, tagout devices, and other energy control measures.

(5) Protective materials and hardware. (i) Locks, tags, chains, wedges, key blocks, adapter pins, self-locking fasteners, or other hardware shall be provided by the employer for isolating, securing or blocking of machines or equipment from energy sources.

(ii) Lockout devices and tagout devices shall be singularly identified; shall be the only device(s) used for controlling energy; shall not be used for other purposes; and shall meet the following requirements:

(A) Durable. (1) Lockout and tagout devices shall be capable of withstanding the environment to which they are exposed for the maximum period of time that exposure is expected.

(2) Tagout devices shall be constructed and printed so that exposure to weather conditions or wet and damp locations will not cause the tag to deteriorate or the message on the tag to become illegible.

(3) Tags shall not deteriorate when used in corrosive environments such as areas where acid and alkali chemicals are handled and stored.

(B) Standardized. Lockout and tagout devices shall be standardized within the facility in at least one of the following criteria: Color; shape; or size; and additionally, in the case of tagout devices, print and format shall be standardized.

(C) Substantial—(1) Lockout devices. Lockout devices shall be substantial enough to prevent removal without the use of excessive force or unusual techniques, such as with the use of bolt cutters or other metal cutting tools.
OSHA 29 CFR 1910.147—LOCKOUT/TAGOUT (CONTINUED)

(2) Tagout devices. Tagout devices, including and their means of attachment, shall be substantial enough to prevent inadvertent or accidental removal. Tagout device attachment means shall be of a non-reusable type, attachable by hand, self-locking, and non-releasable with a minimum unlocking strength of no less than 50 pounds and having the general design and basic characteristics of being at least equivalent to a one-piece, all-environment-tolerant nylon cable tie.

(D) Identifiable. Lockout devices and tagout devices shall indicate the identity of the employee applying the device(s).

(iii) Tagout devices shall warn against hazardous conditions if the machine or equipment is energized and shall include a legend such as the following: Do Not Start, Do Not Open, Do Not Close, Do Not Energize, Do Not Operate.

(6) Periodic inspection. (i) The employer shall conduct a periodic inspection of the energy control procedure at least annually to ensure that the procedure and the requirements of this standard are being followed.

(A) The periodic inspection shall be performed by an authorized employee other than the one(s) utilizing the energy control procedure being inspected.

(B) The periodic inspection shall be designed to correct any deviations or inadequacies observed.

(C) Where lockout is used for energy control, the periodic inspection shall include a review, between the inspector and each authorized employee, of that employee’s responsibilities under the energy control procedure being inspected.

(D) Where tagout is used for energy control, the periodic inspection shall include a review, between the inspector and each authorized and affected employee, of that employee’s responsibilities under the energy control procedure being inspected.

(i) The employer shall certify that the periodic inspections have been performed. The certification shall identify the machine or equipment on which the energy control procedure was being utilized, the date of the inspection, the employees included in the inspection, and the person performing the inspection.

(7) Training and communication. (i) The employer shall provide training to ensure that the purpose and function of the energy control program are understood by employees and that the knowledge and skills required for the safe application, usage, and removal of energy controls are required by employees. The training shall include the following:

(A) Each authorized employee shall receive training in the recognition of applicable hazardous energy sources, the type and magnitude of the energy available in the workplace, and the methods and means necessary for energy isolation and control.

(B) Each affected employee shall be instructed in the purpose and use of the energy control procedure.

(C) All other employees whose work operations are or may be in an area where energy control procedures may be utilized, shall be instructed about the procedure, and about the prohibition relating to attempts to restart or reenergize machines or equipment which are locked out or tagged out.

(ii) When tagout systems are used, employees shall also be trained in the following limitations of tags:

(A) Tags are essentially warning devices affixed to energy isolating devices, and do not provide the physical restraint on those devices that is provided by a lock.

(B) When a tag is attached to an energy isolating means, it is not to be removed without authorization of the authorized person responsible for it, and it is never to be bypassed, ignored or otherwise defeated.

(C) Tags must be legible and understandable by all authorized employees, affected employees, and all other employees whose work operations are or may be in the area, in order to be effective.

(D) Tags and their means of attachment must be made of materials which will withstand the environmental conditions encountered in the workplace.

(E) Tags may evoke a false sense of security, and their meaning needs to be understood as part of the overall energy control program.

(F) Tags must be securely attached to energy isolating devices so that they cannot be inadvertently or accidentally detached during use.

(iii) Employee retraining.

(A) Retraining shall be provided for all authorized and affected employees whenever there is a change in their job assignments, a change in machines, equipment or processes that present a new hazard, or when there is a change in the energy control procedures.

(B) Additional retraining shall also be conducted whenever a periodic inspection under paragraph (c)(6) of this section reveals, or whenever the employer has reason to believe, that there are deviations from or inadequacies in the employee’s knowledge or use of the energy control procedures.

(C) The retraining shall reestablish employee proficiency and introduce new or revised control methods and procedures, as necessary.

(iv) The employer shall certify that employee training has been accomplished and is being kept up to date. The certification shall contain each employee’s name and dates of training.

(8) Energy isolation. Implementation of lockout or the tagout system shall be performed only by authorized employees.

(9) Notification of employees. Affected employees shall be notified by the employer or authorized employee of the application and removal of lockout devices or tagout devices. Notification shall be given before the controls are applied, and after they are removed from the machine or equipment.

(d) Application of control. The established procedure for the application of energy control (implementation of lockout or tagout system procedures) shall cover the following elements and actions and shall be done in the following sequence:

(1) Preparation for shutdown. Before an authorized or affected employee turns off a machine or equipment, the authorized employee shall have knowledge of the type and magnitude of the energy, the hazards of the energy to be controlled, and the method or means to control the energy.

(2) Machine or equipment shutdown. The machine or equipment shall be turned off or shut down using the procedures required by this standard. An orderly shutdown must be utilized to avoid any additional or increased hazard(s) to employees as a result of equipment deenergization.
(3) Machine or equipment isolation. All energy isolating devices that are needed to control the energy to the machine or equipment shall be physically located and operated in such a manner as to isolate the machine or equipment from the energy source(s).

(4) Lockout or tagout device application. (i) Lockout or tagout devices shall be affixed to each energy isolating device by authorized employees.

(ii) Lockout devices, where used, shall be affixed in a manner that will hold the energy isolating devices in a “safe” or “off” position.

(iii) Tagout devices, where used, shall be affixed in such a manner as will clearly indicate that the operation or movement of energy isolating devices from the “safe” or “off” position is prohibited.

(A) Where tagout devices are used with energy isolating devices designed with the capability of being locked, the tag attachment shall be fastened at the same point at which the lock would have been attached.

(B) Where a tag cannot be affixed directly to the energy isolating device, the tag shall be located as close as safely possible to the device, in a position that will be immediately obvious to anyone attempting to operate the device.

(5) Stored energy. (i) Following the application of lockout or tagout devices to energy isolating devices, all potentially hazardous stored or residual energy shall be relieved, disconnected, restrained, and otherwise rendered safe.

(ii) If there is a possibility of reaccumulation of stored energy to a hazardous level, verification of isolation shall be continued until the servicing or maintenance is completed, or until the possibility of such accumulation no longer exists.

(6) Verification of isolation. Prior to starting work on machines or equipment that have been locked out or tagged out, the authorized employee shall verify that isolation and de-energization of the machines or equipment have been accomplished.

(e) Release from lockout or tagout. Before lockout or tagout devices are removed and energy is restored to the machine or equipment, procedures shall be followed and actions taken by the authorized employee(s) to ensure the following:

(1) The machine or equipment. The work area shall be inspected to ensure that nonessential items have been removed and to ensure that machine or equipment components are operationally intact.

(2) Employees. (i) The work area shall be checked to ensure that all employees have been safely positioned or removed.

(ii) Before lockout or tagout devices are removed and before machines or equipment are energized, affected employees shall be notified that the lockout or tagout devices have been removed.

(3) Lockout or tagout devices removal. Each lockout or tagout device shall be removed from each energy isolating device by the employee who applied the device. Exception to paragraph (e)(3): when the authorized employee who applied the lockout or tagout device is not available to remove it, that device may be removed under the direction of the employer, provided that specific procedures and training for such removal have been developed, documented and incorporated into the employer’s energy control program. The employer shall demonstrate that the specific procedure provides equivalent safety to the removal of the device by the authorized employee who applied it. The specific procedure shall include at least the following elements:

(i) Verification by the employer that the authorized employee who applied the device is not at the facility;

(ii) Making all reasonable efforts to contact the authorized employee to inform him/her that his/her lockout or tagout device has been removed; and

(iii) Ensuring that the authorized employee has this knowledge before he/she resumes work at that facility.

(f) Additional requirements. (1) Testing or positioning of machines, equipment or components thereof. In situations in which lockout or tagout devices must be temporarily removed from the energy isolating device and the machine or equipment energized to test or position the machine, equipment or component thereof, the following sequence of actions shall be followed.

(i) Clear the machine or equipment of tools and materials in accordance with paragraph (e)(1) of this section;

(ii) Remove employees from the machine or equipment area in accordance with paragraph (e)(2) of this section;

(iii) Remove the lockout or tagout devices as specified in paragraph (e)(3) of this section;

(iv) Energize and proceed with testing or positioning;

(v) De-energize all systems and reapply energy control measures in accordance with paragraph (d) of this section to continue the servicing and/or maintenance.

(2) Outside personnel (contractors, etc.). (i) Whenever outside servicing personnel are to be engaged in activities covered by the scope and application of this standard, the on-site employer and the outside employer shall inform each other of their respective lockout or tagout procedures.

(ii) The on-site employer shall ensure that his/her personnel understand and comply with restrictions and prohibitions of the outside employer’s energy control procedures.

(3) Group lockout or tagout. (i) When servicing and/or maintenance is performed by a crew, craft, department or other group, they shall utilize a procedure which affords the employees a level of protection equivalent to that provided by the implementation of a personal lockout or tagout device.

(ii) Group lockout or tagout devices shall be used in accordance with the procedures required by paragraph (c)(4) of this section including, but not necessarily limited to, the following specific requirements:

(A) Primary responsibility is vested in an authorized employee for a set number of employees working under the protection of a group lockout or tagout device (such as an operations lock);

(B) Provision for the authorized employee to ascertain the exposure status of individual group members with regard to the lockout or tagout of the machine or equipment; and

(C) When more than one crew, craft, department, etc., is involved, assignment of overall job-associated lockout or tagout control responsibility to an authorized employee designated to coordinate affected work forces and ensure continuity of protection; and
OSHA 29 CFR 1910.147—LOCKOUT/TAGOUT (CONTINUED)

(D) Each authorized employee shall affix a personal lockout or tagout device to the group lockout device, group lockbox, or comparable mechanism when he or she begins work, and shall remove those devices when he or she stops working on the machine or equipment being serviced or maintained.

(4) Shift or personnel changes. Specific procedures shall be utilized during shift or personnel changes to ensure the continuity of lockout or tagout protection, including provision for the orderly transfer of lockout or tagout devices between outgoing and oncoming employees, to minimize exposure to hazards from the unexpected energizing, start-up of the machine or equipment, or release of stored energy.

Note: The following Appendix to §1910.147 serves as a nonmandatory guideline to assist employers and employees in complying with the requirements of this section, as well as to provide other helpful information. Nothing in the Appendix adds to or detracts from any of the requirements of this section.

APPENDIX A—TYPICAL MINIMAL LOCKOUT OR TAGOUT SYSTEM PROCEDURES

GENERAL

Lockout is the preferred method of isolating machines or equipment from energy sources. To assist employers in developing a procedure which meets the requirements of the standard, however, the following simple procedure is provided for use in both lockout or tagout programs. This procedure may be used when there are limited number or types of machines or equipment or there is a single power source. For more complex systems, a more comprehensive procedure will need to be developed, documented, and utilized.

LOCKOUT (OR TAGOUT) PROCEDURE FOR (NAME OF COMPANY).

PURPOSE

This procedure establishes the minimum requirements for the lockout or tagout of energy isolating devices. It shall be used to ensure that the machine or equipment is isolated from all potentially hazardous energy, and locked out or tagged out before employees perform any servicing or maintenance activities where the unexpected energizing, start-up or release of stored energy could cause injury (Type(s) and Magnitude(s) of Energy and Hazards).

RESPONSIBILITY

Appropriate employees shall be instructed in the safety significance of the lockout (or tagout) procedure (Name(s)/Job Title(s) of employees authorized to lockout or tagout). Each new or transferred affected employee and other employees whose work operations are or may be in the area shall be instructed in the purpose and use of the lockout or tagout procedure (Name(s)/Job Title(s) of affected employees and how to notify).

PREPARATION FOR LOCKOUT OR TAGOUT

Make a survey to locate and identify all isolating devices to be certain which switch(es), valve(s) or other energy isolating devices apply to the equipment to be locked or tagged out. More than one energy source (electrical, mechanical or others) may be involved. (Type(s) and Location(s) of energy isolating means.)

SEQUENCE OF LOCKOUT OR TAGOUT SYSTEM PROCEDURE

(1) Notify all affected employees that a lockout or tagout system is going to be utilized and the reason therefor. The authorized employee shall know the type and magnitude of energy that the machine or equipment utilizes and shall understand the hazards thereof.

(2) If the machine or equipment is operating, shut it down by the normal stopping procedure (depress stop button, open toggle switch, etc.).

(3) Operate the switch, valve, or other energy isolating device(s) so that the equipment is isolated from its energy source(s). Stored energy (such as that in springs, elevated machine members, rotating flywheels, hydraulic systems, and air, gas, steam, or water pressure, etc.) must be dissipated or restrained by methods such as repositioning, blocking, bleeding down, etc. (Type(s) of Stored Energy—methods to dissipate or restrain.)

(4) Lockout and/or tagout the energy isolating devices with assigned individual lock(s) and tag(s) (Method(s) Selected; i.e., locks tags, additional safety measures).

(5) After ensuring that no personnel are exposed, and as a check on having disconnected the energy sources, operate the push button or other normal operating controls to make certain the equipment will not operate (Type(s) of Equipment checked to ensure disconnections).

CAUTION: Return operating control(s) to “neutral” or “off” position after the test.

(6) The equipment is now locked out or tagged out.

RESTORING MACHINES OR EQUIPMENT TO NORMAL PRODUCTION OPERATIONS

(1) After the servicing and/or maintenance is complete and equipment is ready for normal production operations, check the area around the machines or equipment to ensure that no one is exposed.

(2) After all tools have been removed from the machine or equipment, guards have been reinstalled and employees are in the clear, remove all lockout or tagout devices. Operate the energy isolating devices to restore energy to the machine or equipment.

PROCEDURE INVOLVING MORE THAN ONE PERSON

In the preceding steps, if more than one individual is required to lockout or tagout equipment, each shall place his/her own personal lockout device or tagout device on the energy isolating device(s). When an energy isolating device cannot accept multiple locks or tags, a multiple lockout or tagout device (hasp) may be used. If lockout is used, a single lock may be used to lockout the machine or equipment with the key being placed in a lockout box or cabinet which allows the use of multi-tiple locks to secure it. Each employee will then use his/her own lock to secure the box or cabinet. As each person no longer needs to maintain his or her lockout protection, that person will remove his/her lock from the box or cabinet. (Name(s)/Job Title(s) of employees authorized for group lockout or tagout.)
BASIC RULES FOR USING LOCKOUT OR TAGOUT SYSTEM

PROCEDURE

All equipment shall be locked out or tagged out to protect against accidental or inadvertent operation when such operation could cause injury to personnel. Do not attempt to operate any switch, valve, or other energy isolating device where it is locked or tagged out.

LOCKOUT (OR TAGOUT) PROCEDURE

Entry No.  (Description)

1. Name of Company
2. Type(s) and Magnitude(s) of energy and hazards
3. Name(s)/Job Title(s) of employees authorized to lockout or tagout
4. Name(s)/Job Title(s) of affected employees and how to notify
5. Type(s) and Location of energy isolating means
6. Type(s) of Stored Energy—methods to dissipate or restrain
7. Method(s) Selected i.e., locks, tags, additional safety measures, etc.
8. Type(s) of Equipment checked to ensure disconnections
9. Name(s)/Job Title(s) of employees authorized for group lockout or tagout

OSHA 29 CFR 1910.147—LOCKOUT/TAGOUT (CONTINUED)
STD 1-7.3 LOCKOUT/TAGOUT

The purpose of STD 1-7.3 is to establish policies and provide clarification to ensure uniform enforcement of the Lockout/Tagout Standard. STD 1-7.3 also provides for the acceptance of "alternative procedures" in the servicing and maintenance of sophisticated and complex equipment such as that found in the petroleum and chemical industries.

The following is an outline of highlights from STD 1-7.3. This outline is intended to single out some of the new information which was not included in 29 CFR 1910.147. Reference must be made to the entire STD 1-7.3 to ensure complete compliance.

UNDER LETTER I. INTERPRETIVE GUIDANCE

1. Scope (f)(1) provides an explanation of cord and plug connected equipment by defining when the (unplugged) plug is under the exclusive control of the employee performing the servicing and/or maintenance. Listed are the following three options:

   1) plug is physically in the possession of the employee
   2) in arm's reach and in line of sight of the employee
   3) if the employee has affixed a lockout/tagout device on the plug

Scope (f)(2) requires that the company lockout/tagout procedures specify the acceptable procedure for handling cord and plug connected equipment. 2. Procedures (c) states that "similar machines and/or equipment (such as those using the same type and magnitude of energy and the same or similar types of controls) can be covered with a single written procedure."

3. Lockout versus Tagout (a) states that "OSHA has determined that lockout is a surer means of ensuring deenergization of equipment than tagout, and that it is the preferred method." (over tagout)

4. Employees and Training (b) states that "employees who exclusively perform functions related to normal production operations, and who perform servicing and/or maintenance under the protection of normal machine safeguarding, need only be trained as "affected" (rather than "authorized") employees even if tagout procedures are used." (See I.1.d. and I.1.e. of this instruction.)

5. Periodic Inspection by the Employer (a)(3) states that "energy control procedures used less frequently than once a year need be inspected only when used."

6. Equipment Testing or Positioning (no changes from 1910.147)

7. Group Lockout/Tagout states that "group lockout/tagout procedures shall be tailored to the specific industrial operation and may be unique in the manner that employee protection from the release of hazardous energy is achieved. Irrespective of the situation, the requirements of this generic standard specify that each employee performing maintenance or servicing activities shall be in control of hazardous energy during his/her period of exposure."

(a) Group operations normally require that a lockout/tagout program be implemented which ensures that each authorized employee is protected from the unexpected release of hazardous energy by his/her personal lockout/tagout device(s). No employee may affix the personal lockout/tagout device of another employee. Various group lockout/tagout procedures discussed in Appendix C provide for each authorized employee's use of his/her personal lockout/tagout device(s).

(b) One of the most difficult problems addressed by the standard involves the servicing and maintenance of complex equipment. Such equipment is frequently used in the petrochemical and chemical industries. Acceptable group lockout/tagout procedures for complex equipment are discussed further in Appendix C.

The following is the explanation for potentially hazardous stored energy or residual energy which might reaccumulate:

8. Compliance with Group Lockout/Tagout (e)(2) "Monitoring may be accomplished, for example, by observation or with the aid of a monitoring device which will sound an alarm if a hazardous energy level is being approached."

(h) In regards to group lockout/tagout operations, "... a master tag is a personal tagout device if each employee personally signs on and signs off on it and if the tag clearly identifies each authorized employee who is being protected by it."

SUBPART J. CLASSIFICATION OF VIOLATIONS

1. A deficiency in the employer's energy control program and/or procedure that could contribute to a potential exposure capable of producing serious physical harm or death shall be cited as a serious violation.

2. The failure to train "authorized," "affected," and "other" employees as required for their respective classifications should normally be cited as a serious violation.

3. Paperwork deficiencies in lockout/tagout programs where effective lockout/tagout work procedures are in place shall be cited as other-than-serious.
APPENDIX B

This flow diagram does not constitute the exclusive or definitive means of complying with the standard in any particular situation and is presented solely as an aid.
APPENDIX C

A. NORMAL PRODUCTION OPERATIONS

1. Safeguarding of servicing/maintenance workers can be ensured by:
   a. Effective machine safeguarding in compliance with Subpart O (machine guarding requirements—see (A) (2)).
   b. Compliance with 29 CFR 1910.147 (Lockout/Tagout) in situations where the normal production operation safeguards are rendered ineffective or do not protect the servicing/maintenance worker.

2. Routine and repetitive activities are not covered by this standard if alternative measures provide effective protection from the hazards associated with unexpected energizing. Compliance with the machine guarding requirements of Subpart O is an example of such alternative measures.

3. Examples of routine maintenance servicing which can often be done under the protection of “production-mode safeguarding” are: lubricating, draining sumps, servicing of filters, and inspection for leaks and/or mechanical malfunction.

   Examples that are not considered to be normal routine maintenance functions and would therefore trigger the need for lockout/tagout are: replacement of machine or process equipment components such as valves, gauges, linkages, support structure, etc.

4. It is explained that some of the safeguarding alternatives presented in ANSI B11.19 can be used to provide protection while clearing minor jams and performing other minor servicing functions. The two safeguarding alternatives mentioned are interlocked barrier guards and presence sensing devices.

B. GROUP LOCKOUT/TAGOUT

Example procedures are given to illustrate the implementation of a group lockout/tagout procedure involving many energy isolating devices and/or many servicing/maintenance personnel. Several examples are given involving authorized employees who affix personal lockout/tagout devices in a group lockout/tagout setting.

1. Definitions.

   The following new definitions for group lockout/tagout are given:
   a. Primary Authorized Employee is the authorized employee who exercises overall responsibility for adherence to the company lockout/tagout procedure.
   b. Principle Authorized Employee is an authorized employee who oversees or leads a group of servicing/maintenance workers (e.g., plumbers, carpenters, electricians, metal workers, mechanics).
   c. Job-Lock is a device used to ensure the continuity of energy isolation during a multi-shift operation. It is placed upon a lock-box. A key to the job-lock is controlled by each assigned primary authorized employee from each shift.
   d. Job-Tag with Tab is a special tag for tagout of energy isolating devices during group lockout/tagout procedures. The tag of the tab is removed for insertion into the lock-box. The company procedure would require that the tagout job-tag cannot be removed until the tab is rejoined to it.

   e. Master Lockbox is the lockbox into which all keys and tabs from the lockout or tagout devices securing the machine or equipment are inserted and which would be secured by a “job-lock” during multi-shift operations.
   f. Satellite Lockbox is a secondary lockbox or lockboxes to which each authorized employee affixes his/her personal lock or tag.
   g. Master Tag is a document used as an administrative control and accountability device. This device is normally controlled by the operations department personnel and is a personal tagout device if each employee personally signs on and signs off on it, and if the tag clearly identifies each authorized employee who is being protected by it.
   h. Work Permit is a control document which authorizes specific tasks and procedures to be accomplished.

2. Organization.

   A sample “basic organizational structure” is outlined to explain the relationship between and responsibilities of the primary authorized employee, principal authorized employee, authorized employees, and equipment operators.

3. Examples of Procedures for Group Lockout/Tagout.

   Examples are presented for the various methods of lockout/tagout using lockbox procedures.

   a. Four procedures (Type A, Type B, Type C, Type D) address circumstances ranging from a small group of servicing/maintenance employees during a one-shift operation to a comprehensive operation involving many workers over a longer period. They are:

      (1) Type A. Each authorized employee places his/her personal lock or tag upon each energy isolating device and removes it upon departure from that assignment. Each authorized employee verifies or observes the deenergization of the equipment.

      (2) Type B. Under a lockbox procedure, a lock or job-tag with tab is placed upon each energy isolation device after deenergization. The key(s) and removed tab(s) are then placed into a lockbox. Each authorized employee assigned to the job then affixes his/her personal lock or tag to the lockbox. As a member of a group, each assigned authorized employee verifies that all hazardous energy has been rendered safe. The lockout/tagout devices cannot be removed or the energy isolating device turned on until the appropriate key or tab is matched to its lock or tag.

      (3) Type C. After each energy isolating device is locked/tagged out and the keys/tabs inserted into a master lockbox, each servicing/maintenance group “principal” authorized employee places his/her personal lock or tag upon the master lockbox. Each principal authorized employee inserts his/her key into a satellite lockbox to which each authorized employee in that specific group affixes his/her personal lock or tag. As a member of a group, each assigned authorized employee verifies that all hazardous energy has been rendered safe. Only after the servicing/maintenance functions of the specific sub-group have been concluded and the personal locks or tags of the respective employees have been removed from the satellite lockbox can the principal authorized employee remove his/her lock from the master lockbox.
(4) Type D. During operations to be conducted over more than one shift (or even many days or weeks), a system such as described here might be used. Single locks/tags are affixed upon a lockbox by each authorized employee as described at Type B or Type C above. The master lockbox is first secured with a job-lock before subsequent locks by the principal authorized employees are put in place on the master lockbox. The job-lock may have multiple keys if they are in the sole possession of the various primary authorized employees (one on each shift). As a member of a group, each assigned authorized employee verifies that all hazardous energy has been rendered safe. In this manner, the security provisions of the energy control system are maintained across shift changes while permitting reenergization of the equipment at any appropriate time or shift.

b. Normal group lockout/tagout procedures require the affixing of individual lockout/tagout devices by each authorized employee to a group lockout device, as discussed in paragraph B.3.a. of this appendix. However, in the servicing and maintenance of sophisticated and complex equipment, such as process equipment in petroleum refining, petroleum production, and chemical production, there may be a need for adaptation and modification of normal group lockout/tagout procedures in order to ensure the safety of the employees performing the servicing and maintenance. To provide greater worker safety through implementation of a more feasible system, and to accommodate the special constraints of the standard’s requirement for ensuring employees a level of protection equivalent to that provided by the use of a personal lockout or tagout device, an alternative procedure may be implemented if the company documentation justifies it. Lockout/tagout, blanking, blocking, etc., is often supplemented in these situations by the use of work permits and a system of continuous worker accountability. In evaluating whether the equipment being serviced or maintained is so complex as to necessitate a departure from the normal group lockout/tagout procedures (discussed in paragraph B.3.a.), to the use of an alternative procedure, the following factors (often occurring simultaneously) are some of those which must be evaluated: physical size and extent of the equipment being serviced/maintained; the relative inaccessibility of the energy isolating devices; the number of employees performing the servicing/maintenance; the number of energy isolating devices to be locked/tagged out; and the interdependence and interrelationship of the components in the system or between different systems.

(1) “Once the equipment is shut down and the hazardous energy has been controlled, maintenance/servicing personnel, together with operations personnel, must verify that the isolation of the equipment is effective . . .”

(2) (Fifteen) specific issues related to the control of hazardous energy in complex process equipment are described . . . in a typical situation which could be found at any facility.”

c. “It should be noted that the purpose of the lockout/tagout standard is to reduce the likelihood of worker injuries and fatalities during servicing/maintenance operations . . .”
Die Safety Blocks is a comprehensive catalog that features a complete line of die safety blocks and accessories for use whenever dies are being adjusted or repaired. These products can also satisfy lockout/tagout requirements for isolating mechanical energy.

The aluminum die safety blocks featured in the catalog are offered in several shapes and sizes. Products to choose from include:

- X-shaped, U-shaped, and Octagonal Safety blocks
- Adjustable Screw Devices for Use With Octagonal Safety Blocks
- Wedges
- Safety Block Holders
- Electrical Interlock Systems
- Adjustable Safety Blocks

The catalog also includes useful information on determining the size and number of die safety blocks to use.

All products in this catalog are intended and designed to meet the requirements of OSHA and ANSI safety standards.

At Rockford Systems, we are experts at machine guarding because it has been our sole focus for over 50 years. We stand committed to the prevention of injuries and fatalities. Our mission is to enhance the long-term health and quality of life of workers in high-risk occupations, while improving the bottom line of the organizations we serve by increasing compliance, reducing risk, lowering costs and improving productivity.
According to OSHA 29 CFR 1910.217, “The employer shall provide and enforce the use of safety blocks for use whenever dies are being adjusted or repaired in the press.” They are not required during die setting unless die blocks are included in your die setting procedure. They also satisfy the lockout/tagout requirements for isolating mechanical energy.

Die safety blocks are placed between the die punch and holder with the machine stroke up. They are rated to support a static load. The static load represents the combined weight of the press ram, ram components (ram-adjust assembly and connection rod[s] or pitman arm[s]), and the upper die.

In some applications, as many as four safety blocks may be required. This is determined by the size of the press bed and the weight the blocks must support. On larger presses, the total slide weight must then be distributed among the quantity of safety blocks required.

The ram is usually adjustable; therefore, wedges or the adjustable screw device is offered to provide a proper fit. If the die takes up most of the space on the die set, it may be difficult to find a place to insert the block. To avoid accidentally stroking the press or leaving the safety block in the die after use, an electrical power cut-off interlock system should be used.

Note: Electrical interlocking of die safety blocks to the machine’s motor and control circuits is required by ANSI B11.19.

ALUMINUM DIE SAFETY BLOCK SYSTEM

This high-strength die safety block is lightweight and comes in several sizes. The unique shape and mechanical properties of the 6063-T5 material have been calculated according to stringent structural aluminum design analysis standards to provide high strength.

To determine the number of die safety blocks required, the static load each die safety block will support, and the length of each block, please follow the instructions below and on the next page.

1. Determining the static load the die safety block(s) will support:

   The actual static load that the die safety block(s) will support is determined by adding the actual weights of the press slide and slide components (ram-adjustment assembly, connection rod[s] or pitman arm[s], and the upper die).

   If this weight cannot be determined, an approximate static load can be calculated using the information and formulas on the next page.
DIE SAFETY BLOCKS

2. Determining the Die Safety Block Length
With the machine at the top of its stroke; stroke up — adjustment up (S.U.A.U. – see previous page), measure the space between the upper and lower die set plates (not the distance between the bolster and slide). This gives the maximum safety block length. To determine the stroke up — adjustment down (S.U.A.D. – see previous page) measurement, subtract the ram adjustment from the S.U.A.U. figure. This provides the minimum length of the die safety block.

Total Length of Die Safety Block Required ___________

EXCEPTIONS
A. If wedges will be used, subtract 1½” maximum. This is an allowance for variation in the stopping point of the crankshaft or adjustment of the ram. Total Length of Die Safety Block Required ___________

B. When an adjustable screw is added to an octagonal safety block, the minimum length of the aluminum portion of the safety block is as follows:

   - For small and medium safety blocks
     2½” plus the size of the adjustable screw device

   - For large safety blocks
     3” plus the size of the adjustable screw device

When an adjustable screw device is added to an octagonal safety block and the screw is all the way inside of the safety block, it will add 2” to the overall length of small and medium safety blocks and 21/2” to the overall length of large safety blocks. Therefore, subtract 2” for small or medium blocks and 21/2” for large blocks to determine the length of the aluminum portion of the die block.

Example: If the minimum overall length of the small or medium safety block required is 10½” with any size adjustable screw device, the aluminum portion of the safety block would be 8½” (10½” - 2” = 8½”).

Example: If the minimum overall length of the large safety block required is 16” with any size adjustable screw device, the aluminum portion of the safety block would be 13½” (16” - 2½” = 13½”).

Total Length of the Aluminum Portion of the Die Safety Block ___________

3. Determining the Size of the Die Safety Block
The size of the die safety block (small, medium, large) is determined by one or both of the following factors:

A. The size of the block itself and the area available in the die. (See static load charts.)

B. The static load capacity of the block (small, medium, large) versus the total static load being supported. (See static load charts.)
X-SHAPED SAFETY BLOCKS

To determine the number of safety blocks required, the static load each safety block will support, and the length of each block, please refer to pages 2-3.

The X-shaped safety blocks can be furnished four different ways:

A) Cut to length with a hole and pin for an interlock chain or wedges
B) Cut to length only
C) In a nine-foot length
D) Cut to length with a hole and pin for an interlock chain or wedges and a base plate installed (order base plate separately; see page 6)

†Powder coating available on request—please consult the factory.
To determine the number of safety blocks required, the static load each safety block will support, and the length of each block, please refer to pages 2-3.

The octagonal safety blocks can be furnished four different ways:

A) Cut to length with a hole and pin for an interlock chain and with an adjustable screw device and/or base plate installed (order adjustable screw device and/or base plate separately; see below and page 6)

B) Cut to length with a hole and pin for an interlock chain or wedges

C) Cut to length only

D) In a nine-foot length

The approximate static loads shown in this chart have a built-in safety factor of two.

Adjustable Screw Device—For Use With Octagonal Safety Blocks Only

This heavy-duty steel screw device is added to the octagonal shaped safety blocks. These screws are needed to prevent any space between the block and die when various dies are used or when the slide is adjusted.

Note: If an adjustable screw device is mounted to an octagonal safety block, you must use the approximate static loads shown in the chart. This is because the adjustable screw devices will not hold as heavy a static load as the octagonal safety blocks by themselves.
SAFETY BLOCK BASE

This safety block base can be added to U-shaped, octagonal-shaped, and X-shaped safety blocks. The base adds stability to help prevent the die block from tipping over. Available in 1/2” thick steel or aluminum.

LIFTING HANDLE—PART NO. KTS633

The aluminum lifting handle is a convenient option for all safety blocks that are used frequently.

ELECTRICAL INTERLOCK SYSTEMS

According to ANSI B11.19, safety blocks “shall be interlocked with the machine to prevent actuation of hazardous motion of the machine.” The following interlock systems will satisfy this requirement. The interlock must be interfaced into the control system so that when the plug is pulled, the power to the main drive motor and control is disconnected. If the machine has a mechanical energy source, such as a flywheel, it must come to rest before the die block can be inserted. The interlock system is available in a yellow plug with one contact or an orange plug with two contacts. The interlock system includes the plug, a 24” long chain, a receptacle, and an electrical mounting box.

Part No. KTS518
One-contact interlock system with 24” chain

Part No. KTS533
Two-contact interlock system with 24” chain
ADJUSTABLE DIE SAFETY BLOCKS

These adjustable safety blocks feature a tough malleable-iron bell-bottom base, a convenient handle for lifting, and precision-cut acme threads for easy adjustment and extra rigidity. The adjusting screw can be easily adjusted up or down by hand. Turning holes are also provided in the screw neck to facilitate the use of a turning bar, if required.

Machine Safeguarding Seminars gives a complete overview of our 2 1/2-day machine safeguarding seminar.

We have been educating individuals on machine safeguarding since the company was started. Seminars take place at our training center in Rockford, Illinois.

This monthly seminar covers safeguarding for fabricating machines, cutting machines, and large work envelopes.

The seminar explains how to safeguard machines to meet OSHA and ANSI standards and best safety practices.

At Rockford Systems, we are experts at machine guarding because it has been our sole focus for over 50 years. We stand committed to the prevention of injuries and fatalities. Our mission is to enhance the long-term health and quality of life of workers in high-risk occupations, while improving the bottom line of the organizations we serve by increasing compliance, reducing risk, lowering costs and improving productivity.
ROCKFORD SYSTEMS’ QUALIFICATIONS

For many years Rockford Systems has been educating corporations throughout the world on machine safeguarding. Every year, hundreds of people attend these seminars. Participants come from a variety of areas including manufacturing, distribution, aerospace, insurance, government, and consulting. They include safety directors, plant managers, maintenance and engineering personnel, setup people, safety specialists, loss-control engineers, and safety consultants. Seminar instructors are very knowledgeable and have many years of experience in the machine tool industry.

MACHINE SAFEGUARDING SEMINAR OVERVIEW

According to safety standards, when a machine creates a hazard to operators and other employees in the machine area, it must be safeguarded. Rockford Systems offers a machine safeguarding seminar to teach people in positions of responsibility how to safeguard the point of operation and other machine hazards to meet these safety standards.

This 2½-day seminar explains how to interpret the performance language of both OSHA (Occupational Safety and Health Administration) and ANSI (American National Standards Institute) standards. Specific machine safeguarding situations are also discussed. Another section of the machine safeguarding seminar provides basic safeguarding guidelines for other metalworking machines using the ANSI B11-series safety standards.

Seminars combine classroom discussion with demonstrations of machines under power. Hands-on experience with these machines and visual aids, including slides and videos, are also used. These teaching methods enable the participants to interpret the OSHA and ANSI standards as they relate to their specific machine applications and production requirements.

DAY-TO-DAY OUTLINE OF SAFEGUARDING SEMINAR

Day 1  8:00 a.m. to 5:00 p.m.
- Welcome, Introduction, and Objectives of Seminar
- Brief History of ANSI, OSHA, and NFPA-79
- Risk Reduction
- OSHA 29 CFR 1910.211, Definitions
- OSHA 29 CFR 1910.212, General Requirements for All Machines and Auxiliary Equipment
- ANSI B11.1-2009 Mechanical Power Presses
- Full-Revolution-Clutch Identification and Control Requirements
- Part-Revolution-Clutch Identification and Control Requirements
- Control Reliability and Brake Monitoring
- Electrical Component Requirements (NFPA-79)
- Hand-Feeding Tools
- Point-Of-Operation Safeguarding—Guards, Devices, Methods
- Design, Construction, Setting, and Feeding of Dies
- Inspection and Maintenance Records
- Instruction to Operators
- Reports of Injuries
- Mechanical Power-Transmission Apparatus (OSHA 1910.219)

Day 2  8:00 a.m. to 5:00 p.m.
- ANSI B11.2 Hydraulic Power Presses
- ANSI B11.3 Power Press Brakes
- ANSI B11.4 Shears
- ANSI B11.5 Iron Workers
- ANSI B11.6 Lathes (Manually Operated)
- ANSI B11.7 Cold Header and Cold Formers
- ANSI B11.8 Drilling, Milling, and Boring Machines
- ANSI B11.9 Grinding Machines
- ANSI B11.10 Metal Sawing Machines
- ANSI B11.11 Gear Cutting Machines
- ANSI B11.12 Roll Forming and Roll Bending Machines
- ANSI B11.13 Automatic Screw/Bar and Chucking Machines
- ANSI B11.14 Coil Slitting Machines/Systems Withdrawn—See ANSI B11.18
- ANSI B11.15 Pipe, Tube, and Shape Bending Machines
- ANSI B11.16 Metal Powder Compacting Presses
- ANSI B11.17 Horizontal Hydraulic Extrusion Presses
- ANSI B11.18 Coil Processing Slitting/Blanking
- ANSI B11.19 Safeguarding Methods (Criteria)
- ANSI B11.20 Integrated Manufacturing (Cells)
- ANSI B11.21 Machine Tools/Laser (Cutting)
- ANSI B11.22 CNC Turning Centers and Lathes
- ANSI B11.23 Machining Centers—CNC Mills, Drills, Boring
- ANSI B11.24 Transfer Machines
- ANSI/SPI B151.1 Horizontal (Plastic Injection Molding Machines)

Day 2 (Continued)
- BS ISO 14137 and JIS B6360 Electrical Discharge (EDM) Machines
- ANSI B152.1 Hydraulic Die Casting Presses
- ANSI/RIA R15.06–1999 & 2012 Robots and Large Work Envelopes
- OSHA 1910.147 Control of Hazardous Energy Lockout/Tagout

Day 3  8:00 a.m. to 10:00 a.m.
- Machine Demonstrations

SEMINAR MATERIALS

Each person attending this seminar receives a variety of information regarding machine safeguarding which includes reprints of the following:
- Charts and graphs for future reference
- Safeguarding product catalogs
- U.S. Department of Labor memorandums
- Mechanical Power Press Safety Information Card
- Safety Distance Guide Slide Chart
- Folding, Metal OSHA Guard-Opening Scale
- Laminated function-testing checklists for safeguards
